<b></b>	
	presented in the form of a mapping document appended to this course specification (see Appendix E) which outlines how the modules serve to fulfil the various aspects of the apprenticeship standard, including an indication of whether the coverage is full/partial/basic.
Course Learning Outcomes	Program Specific Learning Outcomes (UKSPEC) This course is designed to meet the learning outcomes specified by the UK Engineering Council in its requirements for Accreditation of Higher Education Programmes (AHEP3) that fully satisfy the educational requirements for Engineering Technician, EngTech, status and partially satisfy the education requirements for Incorporated Engineer, IEng, status. The course learning outcomes are based upon the six categories of learning outcomes identified by the UK Engineering Council.
	<ol> <li>Knowledge and Understanding         Engineering is underpinned by science and mathematics and other associated disciplines as defined by the relevant professional engineering institutions. Students will need the following knowledge understanding and abilities:         A1: Knowledge and understanding of scientific principles and methodology necessary to underpin their education in their engineering discipline, to enable appreciation of its scientific and engineering context, and to support their understanding of historical, current, and future developments and technologies.     </li> <li>A2: Knowledge and understanding of mathematical principles necessary to underpin their education in their engineering discipline and to enable them to seek to apply mathematical and methods, tools and notations in the analysis and solution of engineering problems.     </li> <li>A3: Ability to apply knowledge and understanding to support study of their own engineering discipline.</li> </ol>
	<ul> <li>2. Intellectual Skills</li> <li>Engineering analysis involve the application of engineering concepts and tools to the solution of engineering problems. Students must be able to demonstrate:</li> <li>B1: Ability to monitor, interpret and apply the results of analysis and modelling in order to bring about continuous improvement.</li> <li>B2: Ability to apply quantitative methods in order to understand the performance of systems and components.</li> <li>B3: Ability to use the results of engineering analysis to solve engineering problems and to recommend appropriate action.</li> <li>B4: Ability to apply an integrated or systems approach to engineering problems through know how of the relevant technologies and their application.</li> </ul>
	<ul> <li><b>3. Practical Skills</b></li> <li>This involves the practical application of engineering skills, combining theory and experience, and the use of other relevant knowledge and skills. Students must be able to demonstrate:</li> <li><b>C1</b>: knowledge of contexts in which engineering knowledge can be applied (e.g. operations and management, technology development, etc.).</li> </ul>

	C2. Unaveloding of characteristics of particular materials, carriers art
	<b>C2</b> : knowledge of characteristics of particular materials, equipment,
	processes, or products.
	<b>C3</b> : Workshop and laboratory skills.
	<b>C4</b> : Ability to use and apply information or translate information from
	technical literature and other information sources.
	<b>C5</b> : Understanding of appropriate codes of practice and industry
	standards.
	<b>C6</b> : Awareness of quality issues and their application to continuous improvement.
	<b>C7</b> : Awareness of team roles and the ability to work as a member of an engineering team.
	<b>C8</b> : Understanding of the need for a high level of professional and
	ethical conduct in engineering and a knowledge of professional codes of conduct.
	4. Transferable Skills
	Design is the creation and development of an economically viable
	product, process or system to meet a defined need. It involves
	significant technical and intellectual challenges and can be used to
	integrate all engineering understanding, knowledge and skills to the
	solution of real problems. Students and graduates must be able to
	demonstrate:
	D1: Understand business customer and user needs.
	<b>D2</b> : identify constraints including environmental and sustainability
	limitations; ethical, health, safety, security and risk issues, intellectual
	property; code of practice and standards.
	<b>D3</b> : Apply problem-solving skills to establish generic solutions
	<b>D4</b> : Work individually and as part of a team.
L	C Teaching and Learning Strategy

#### C. Teaching and Learning Strategy

### General Learning Outcomes (UK-SPEC)

#### Knowledge and Understanding:

Graduates must be able to demonstrate their knowledge and they must have an appreciation of the wider multidisciplinary engineering context and its underlying principles. They must appreciate the social, environmental, ethical, economic and commercial considerations affecting the exercise of their engineering judgement.

#### Teaching and learning strategies:

Acquisition of knowledge and understanding is acquired through in the main by modules teaching and developing knowledge and understanding within a multidisciplinary engineering context and those at higher levels involve a degree of commercial awareness through design of systems to specifications.

#### Assessment

Assessment is through examinations and also practical work and assignments using logbooks and formal reports.

#### Intellectual Skills:

Graduates must be able to apply appropriate quantitative science and engineering tools to the analysis of problems. They must be able to demonstrate creative and innovative ability in the synthesis of solutions and in formulating designs. They must be able to comprehend the broad picture and thus work with an appropriate level of detail.

#### Teaching and learning strategies:

Acquisition of IS is gained through the specialist level 5 modules. In these modules students are taught the appropriate tools to solve engineering problems. Innovation is covered in the module entitled Team Design Project at level 5 which develops business ideas from innovative research and development activities.

#### Assessment

Assessment of IS is through presentations and also formal reports at various stages of project work including a feasibility study. Innovation and design skills are assessed by group work as well as a formal report.

#### **Practical skills:**

Graduates must possess practical engineering skills acquired through, for example, work carried out in laboratories and workshops; in industry through supervised work experience; in individual and group project work; in design work; and in the development and use of computer software in design, analysis and control. Evidence of group working and of participation in a major project is expected. However, individual professional bodies may require particular approaches to this requirement.

#### Teaching and learning strategies:

- Acquisition of PS is acquired during the practical laboratory sessions which constitute a part of nearly every module for this course.
- Further development of these skills is acquired in the Level 5 team project.

#### Assessment

PS is assessed by log books, coursework assignments and also the level 5 team project which include presentation and a viva voce examination.

#### General transferable skills:

Graduates must have developed transferable skills that will be of value in a wide range of situations. These are exemplified by the Qualifications and Curriculum Authority Higher Level Key Skills and include problem solving, communication, and working with others, as well as the effective use of general IT facilities and information retrieval skills. They also include planning self-learning and improving performance, as the foundation for lifelong learning/CPD.

#### Teaching and learning strategies:

Acquisition of GTS is achieved through communication of knowledge in formal reports. These constitute a part of the assessment for the majority of modules on the course.

#### Assessment

GT skills are assessed by formal reports, presentations and viva voce examinations of the L5 team project.

#### Teaching and Learning overview (Block Release)

The course is made up of several modules (see section G below) and each module is delivered through a combination of lectures, tutorials, practical workshops, computing workshops etc. all of which amounts to directed teaching (class room contact). There is a variance in the make up of the number of hours dedicated to lectures, workshops etc but the total number of study hours attracted by each module is dependent on the module weighting in credits. Typically, a 20-credit module, requires 200 hours of learning which constitutes both directed learning and independent learning. It is envisaged that for modules delivered via block-release delivery, the lectures are pre-recorded and made available via VLE for learners to become familiar therefore a reduce direct contact time will be scheduled during the block week which is catered for mandatory face-to-face contact, workshop, tutorials etc

#### Independent Learning

The number of hours of independent learning required is dependent on the nature of the module. Generally, the number of hours of independent learning required increases as you progress from your first year (L4) to final year (L5). Typically, in most taught modules, the directed teaching varies depending on the nature of the content and this may significantly vary in some modules such as Mathematics where more support is offered and Project modules where more individual involvement is expected.

#### Subject-related and generic resources

The core and optional reading lists are supplied at the end of each module guide produced by the module leader. A copy of the module guide will be made available on the Virtual Learning Environment, VLE (Moodle) and the reading lists can also be accessed through LSBU Library website (<u>http://www1.lsbu.ac.uk/library/</u>).

#### Learning Support

To support students in their learning journey, academic and support staff are available during the normal operating hours of the university via prior appointment. Academic staff also operate surgery sessions where no prior appointments are needed. The university buildings and library are open from 8am to 9pm during term time, while the library operates for an extended period during examinations. Some specialist workshops/computing spaces etc. are not accessible outside the normal operating hours of 9am to 5pm, unless timetabled for use in a module. Teaching sessions for PT students run until 8/9pm and the relevant and required areas are open for access as timetabled.

All students are allocated a Personal Tutor when they begin their study at LSBU and your personal tutor is who you would see about any problems, not just academic ones (most academic problems will probably be dealt with by lecturers or module leaders or Course Directors). Students are advised to establish contact with their personal tutor ASAP, and maintain regular meetings throughout their study, more so in the first year on the course. Students are briefed about the tutoring systems during the enrolment and orientation process.

#### **Teaching staff**

Most modules are delivered by full-time academic staff from within the parent division where the course resides and often by staff from other areas within the school or university where expertise lies. We aim to have each module delivered by a single member of staff (for both teaching and coursework). Occasionally, PG students or part-time staff may support certain sessions and, in such cases, the relevant tutors are trained and care is taken to ensure the quality of the provision.

#### VLE

Each course has a course site where relevant information is maintained by the respective course director. This is used to post announcements that reach every student enrolled in the course.

Each module on the course has a Module site and all relevant teaching and learning material such as module guides, lecture notes, teaching slides, tutorial and seminar sheets, workshop exercises, past exam papers etc. are made available by the module leader. The virtual learning environment (Moodle) can be accessed using your windows login credentials and can be accessed from any internet connected PC inside or outside of the university campus.

#### **D.** Assessment

Course work in modules can be either formative or summative and the details are usually made available in the module guide and explained to students by the module leader at the beginning of each semester. The module guide will also provide details as to the weight of these assessment components and associated procedure for them, including submission instructions and deadlines.

Each module has a number of assessment *components*, usually, but not always, two. These can consist of assignments, mini tests, essays, laboratory reports and logbooks and examinations of various kinds. The assessment components for each module are specifically defined and kept up to date in the current Module Guide. Note that a component is not necessarily a single piece of work - several pieces of coursework (often referred to as a portfolio) may constitute a single component of the module assessment.

To pass a module, students must obtain an overall **module mark of no less than 40%** and also a minimum **threshold** mark of **30% in each component**. The weighting of each component for calculating the overall module mark is given in the Module Guide, and the module coordinator (or leader or lecturer in charge) will often cover the details of this at the beginning of the delivery of the module.

Progression means moving on from one year to the next, during the studies. Students need to complete (pass) all modules taken/studied at that level by obtaining the minimum component marks and the minimum module marks. Occasionally, with the discretion of the exam board, students may be allowed to progress with an outstanding module(s) and your course director will explain in detail about these. It is important that you understand how progression works and what the rules are. The rules about progression and what happens when a module is failed are carefully set out (along with all the other University rules) in the Student Handbook, a copy of which is handed to all students during enrolment.

The rules about referrals, repeats and extenuating circumstances are defined by the University's Academic Regulations for Taught Programmes and are described in the Student Handbook and also included in the course guide.

#### E. Academic Regulations, Compensation and Condonement

Local protocols based on professional body requirements will be applied for the accredited courses.

The University's assessment and examination procedures apply for this course and can be accessed via <u>https://www.lsbu.ac.uk/\_\_\_data/assets/pdf\_file/0010/84349/assessment-and-examination-procedure.pdf</u>. Award of compensation is in line with these procedures and currently exam boards have a discretion to allow compensation of up to 40 credits at any one level and a total of 60 credits for the entire course. There is no over-riding protocol from IET regarding compensations (currently). No compensation is allowed on the project modules. Additionally, the Engineering council has set a maximum limit of 30 credits where compensation can be allowed on a Bachelors degree and this will be applied to all students joining the first year of the course from Sep 2022.

Although condonement of modules are allowed as per LSBU assessment and examination procedures, the accrediting body IET has dis-allowed this on all our accredited courses which is applied as a Local Protocol on our current courses. This course will comply with this local protocol,

as we will be seeking accreditation from a joint accreditation board (IET, IMechE and PWI) by the time the first cohort graduates. Also, the Engineering council has ruled that Condonements will not be allowed on any modules delivering AHEP outcomes, which rules out every module on any typical Engineering course.

#### F. Entry Requirements

## <u>Course Entry requirements for BEng (Hons) Rail and Rail Systems Engineering (Signalling and Control)</u>

To be considered for entry to the first year of this course applicants will be required to have the following qualifications:

#### Part-time students

- L3 Network Rail or equivalent Rail apprenticeship; L4 students will be considered for an advanced entry with benefit of few exemptions to modules already covered and similar in nature and content.
- A Level BBB including Mathematics and/or Physical Sciences (120 UCAS points) or;
- BTEC National Diploma DDM, including Level 3 Mathematics and Physical Sciences (128 UCAS points) **or**;
- EAL Technical Extended Diploma in Engineering Technologies, D, including: Further Engineering Mathematics; Electrical and Electronic Engineering Principles; and other options relevant to Electrical and Electronic Engineering **or**;
- Access to HE qualifications with 24 Distinctions and 21 Merits, with at least half the course in Mathematics and Physical Science subjects (122 UCAS points) **or**;
- Equivalent level 3 qualifications worth 120 UCAS points and including Mathematics and Physical Sciences
- Applicants must hold 5 GCSEs A-C including Maths and English or equivalent (reformed GCSEs grade 4 or above) **or**;
- We welcome qualifications from around the world. English language qualifications for international students: IELTS score of 6.0 or Cambridge Proficiency or Advanced Grade C, and a Mathematics qualification equivalent to reformed GCSE grade 4 or above, as assessed by UK NARIC, or;

#### **Recognition of Prior Learning /Transfer Credit**

Applicants may exceptionally be considered for entry to the second year of the course with the following qualifications. Applicants will normally be interviewed and may be required to sit a Mathematics test to ensure their preparedness for direct entry. In addition to the academic suitability, apprentices will also be assessed through a formal interview by the course director to establish that they have adequate work experience to support an advanced entry and that their related work experience can be documented through OneFile towards consideration for their e-portfolio/end point assessment. This will usually be in agreement with the employer so that the apprentice is supported fully.

The final decision to accept will be subject to having no complications with levy funding.

#### Part-time students

AQE October 2017

- BTEC Higher National Diploma in Electrical and Electronic Engineering or a closely-related subject **or**;
- DipHE in a directly-relevant subject or;
- Transfer of 120 Level 4 credits from a directly-equivalent degree course and with the approval of the director of that course **or**;
- An overseas qualification assessed by UK NARIC as equivalent to at least BTEC HND in a closely-related subject **and** an IELTS score of 6.5 or equivalent.

#### **Recognition of Prior Experiential Learning (RPEL)**

RPEL may be taken into account in determining the entry requirements for candidates with relevant work experience, but cannot replace the requirement for formal qualifications in Mathematics.

#### Application to the course

Part-time (apprenticeship route – Levy Funded): direct to the university, via a dedicated webpage

#### G. Course structure(s)

#### **Course overview**

- The academic year is organised into 4 teaching blocks, each lasting one-week and an exam block which lasts 2-3 days.
- The FdEng course is made up of 240 credits and an EPA after completion of study. The course is made up of several modules, most modules are worth 20 credits.
- The part-time FdEng course is delivered across 3 years, in a block-release mode.

FdEng Rail and Rail Systems Engineering (Electrical) – Part time

#### End Point Assessment:

End Point Assessment (EPA) is the name given to a series of tests an apprentice must take to prove their ability to do the job they have been training for. These tests take place at the end of an apprenticeship following a period of training and development often referred to as the 'on-programme' period. In some Standard based apprenticeships, the on-programme stage may include mandatory requirements, such as supporting qualifications. These must be achieved prior to applying for the EPA. At this point the employer, after discussion with their apprentice and training provider, 'signs off' their apprentice as ready for EPA. This decision process is known as the 'gateway' to End Point Assessment.

There is no common format for an EPA; they vary between apprenticeships. All EPA's are developed from 'assessment plans', drawn up by the trailblazer group responsible for the apprenticeship standard. Assessment plans set out the main requirements for the final testing and what methods should be used. As the experts for their respective workforces, employers can determine the knowledge, skills and behaviours required for job roles, and they will be guided on how best to test for occupational competence in their particular industry.

Importantly, EPA's are not designed to test every single aspect of a Standard. Instead they are designed to enable an apprentice to demonstrate that overall, they have developed the key knowledge, skills and behaviours needed to be able to do their job effectively.

Apprenticeship courses broadly fall into two categories based on whether the end point assessment is an integrated element to the apprenticeship degree or not. Where it is an integrated element, the apprentice cannot obtain his degree without successfully completing the end point assessment and where the EPA is not integrated, an apprentice can graduate with a degree (academic qualification) irrespective of the outcome of the EPA, however this has an implication on the final 20% of the funding to be received by the training provider.

Only approved End Point Assessment Organisations (EPAO) registered with the Education and Skills Funding Agency can deliver End Point Assessments. They can either be awarding organisations, like FDQ, training providers or employers and should feature on the <u>Register of End Point Assessment Organisations</u> a list maintained by the Education and Skills Funding Agency and is the ONLY register an EPAO needs to be on to provide End Point Assessment services.

Often professional bodies such as the IET, IMechE who accredit courses are also registered as EPAO and for the current course, either IET, IMechE or PWI will be approached for EPA of all apprentices graduating on this course.

## The End-point assessment for the 'FdEng Rail and Rail Systems Engineering' is not integrated into the apprenticeship degree.

The e-portfolio system, OneFile, used at LSBU is aimed at supporting the apprentice's journey on the course and progress towards the gateway to culminate in the end point assessment (EPA). The purpose of the EPA is to ultimately assess if the learner has met

the standard and its outcomes. Its purpose is to mimic and provide evidence of occupational competence from the work environment. The learner can plan, design, implement and test some artefact. An independent assessor(s) takes a holistic view of the learner's competencies and judges whether they meet the outcomes of the standard.

Every apprentice will be supported, along with employers commitment, to develop a very structured personal development plan which aligns with the knowledge, skills and behaviours within the apprenticeship standard, they will be expected to evidence these as part of their on-line portfolio development. This personal development plan is reviewed as a tri-party process (once per semester) to ensure the apprentice is progressing adequately to be able to meet the gateway requirements and progress to the end point assessment.

The course director (or a skills assessor) along with the employer (line manager and/or mentor) will monitor progress both at University and in the workplace as well as being an invaluable link between the apprentice, LSBU and their employer. They will also be allocated a personal tutor as part of the normal pastoral care for all students within the Division.

**Accreditation:** Although most accrediting bodies are registered as EPAO's, they also accredit the course and both the processes are kept separate through dedicated panels/individuals leading these activities. The accreditation activity occurs once in every 3 to 5 years whereas the EPA activity is on-going once students approach the gateway and is an annual process.

Accreditation for the current course will be sought from a joint accreditation board (IET, IMechE and PWI) as the first cohort of apprentices approach their gateway.

#### List of Appendices

- Appendix A: Curriculum Map
- Appendix B: Educational Framework (undergraduate courses)
- Appendix C: Personal Development Planning (postgraduate courses)
- Appendix D: Terminology
- Appendix E: Mapping of the Knowledge, Skills and Behaviour aspects of the apprenticeship standard

#### Appendix A: Curriculum Map

This map provides a design aid to help course teams identify where course outcomes are being developed, taught and assessed within the course. It also provides a checklist for quality assurance purposes and may be used in validation, accreditation and external examining processes. Making the learning outcomes explicit will also help students to monitor their own learning and development as the course progresses.

#### Appendix B: Embedding the Educational Framework for Undergraduate Courses

The Educational Framework at London South Bank University is a set of principles for curriculum design and the wider student experience that articulate our commitment to the highest standards of academic knowledge and understanding applied to the challenges of the wider world.

The Educational Framework reflects our status as University of the Year for Graduate Employment awarded by *The Times and The Sunday Times Good University Guide 2018* and builds on our 125 year history as a civic university committed to fostering social mobility through employability and enterprise, enabling our students to translate academic achievement into career success.

There are four key characteristics of LSBU's distinctive approach to the undergraduate curriculum and student experience:

- Develop students' professional and vocational skills through application in industry-standard facilities
- Develop our students' graduate attributes, self-awareness and behaviours aligned to our EPIIC values
- Integrate opportunities for students to develop their confidence, skills and networks into the curriculum
- Foster close relationships with employers, industry, and Professional, Statutory and Regulatory Bodies that underpin our provision (including the opportunity for placements, internships and professional opportunities)

The dimensions of the Educational Framework for curriculum design are:

- informed by employer and industry needs as well as professional, statutory and regulatory body requirements
- **embedded learning development** for all students to scaffold their learning through the curriculum taking into account the specific writing and thinking requirements of the discipline/profession
- high impact pedagogies that enable the development of student professional and vocational learning through application in industrystandard or authentic workplace contexts
- inclusive teaching, learning and assessment that enables all students to access and engage the course
- **assessment for learning** that provides timely and formative feedback

All courses should be designed to support these five dimensions of the Educational Framework. Successful embedding of the Educational Framework requires a systematic approach to course design and delivery that conceptualises the student experience of the curriculum as a whole rather than at modular level and promotes the progressive development of understanding over the entire course. It also builds on a well-established evidence base across the sector for the pedagogic and assessment experiences that contribute to high quality learning.

This appendix to the course specification document enables course teams to evidence how their courses meet minimum expectations, at what level where appropriate, as the basis for embedding the Educational Framework in all undergraduate provision at LSBU.

Dimension	Minimum expectations and rationale	How this is achieved in the course
of the		
Educational		
Framework		
Curricula	Outcomes focus and professional/employer	Industrial Advisory boards, both at school level and division level, feeds into the
informed by	links	curriculum design through its twice annually convened meeting.
employer	All LSBU courses will evidence the involvement	
and industry	of external stakeholders in the curriculum	Representatives from professional bodies, are invited to a short seminar session
need	design process as well as plan for the participation of employers and/or alumni through guest lectures or Q&A sessions, employer panels, employer-generated case studies or other input of expertise into the delivery of the course provide students with access to current workplace examples and role models. Students should have access to employers and/or alumni in at least one module at level 4.	as part of the module Design and Practice where students are informed about how they can engage with professional bodies and build relations with the local networking bodies to secure learning of state-of-the-art aspects of their discipline of engineering in the work arena and also to have access to facilities and professional networks operating in the local area. Students are encouraged to become student members of the professional body (IET) and the division pays for the membership to provide a sound start to their professional engagement. Alumni and employers are invited as guest speakers on the above module whose valuable inputs contribute to the student's ideas and activity which they later put use when competing on a national level in challenges such as the London Mayoral Challenge, Engineers without Borders etc.
Embedded learning development	Support for transition and academic preparedness At least two modules at level 4 should include embedded learning development in the	Modules at L4 prepare from the basis for academic preparedness and help them with transition to later years in their course. For e.g.,

curriculum to support student understanding of, and familiarity with, disciplinary ways of thinking academic writing, critical reading, reflection).         Where possible, learning development will be normally integrated into content modules rather than as standalone modules. Other level 4 modules should reference and reinforce the learning development to aid in the transfer of learning.         High impact       Group-based learning experiences	<ul> <li>The mathematics module provides the underpinning knowledge to enable them to think analytically. This is then reinforced in this module where mathematical models taught in lectures are now analysed and simulated using MATLAB Simulink models. Digital Logic Design module also extended elementary algebra knowledge to Boolean Algebra. This allows students to dissect the model deeper and gain a better understanding in terms of boundary conditions and constraints within which these analytical models can be validated.</li> <li>Academic writing, in its various forms is introduced and strengthened when they produce a variety of reports for the various modules they study at L4: <ul> <li>As part of Design and Practice module, they produce individual and team reports, engage with a personal tutor, maintain record of their meetings, produce a portfolio etc.</li> <li>As part of the Programming for Engineers, they produce evidence of working on development environments (IDE) through a comprehensive logbook and case study.</li> <li>As part of the Analog and Digital Electronics, they produce a digital logbook as an ePortfolio and experience the process of submission of their records digitally through VLE and receive individual feedback via the VLE.</li> <li>As part of the Principles of Electrical Engineering module, students experience the workplace scenario where they are required to follow basic health and safety aspects related to working in places where death by electrocution is a hazard. They also maintain a hand-written record of their experience in the workshop while they progress through a set of time scheduled exercises. This helps them to put learning into practice in a timely and organised way whilst also recording data in a meaningful way and they are encourage and allow students to work in small groups of</li> </ul></li></ul>
pedagogies	2 to 3 in various settings, and experiencing various learning techniques be it

Inclusive teaching, learning and assessment	The capacity to work effectively in teams enhances learning through working with peers and develops student outcomes, including communication, networking and respect for diversity of perspectives relevant to <b>professionalism</b> and <b>inclusivity</b> . At least one module at level 4 should include an opportunity for group working. Group-based learning can also be linked to assessment at level 4 if appropriate. Consideration should be given to how students are allocated to groups to foster experience of diverse perspectives and values. <u>Accessible materials, resources and activities</u> All course materials and resources, including course guides, PowerPoint presentations, handouts and material available from VLE (Moodle) should be provided in an accessible format. For example, font type and size, layout and colour as well as captioning or transcripts for audio-visual materials. Consideration should also be given to accessibility and the availability of alternative formats for reading lists.	<ul> <li>peer learning, or communication and networking with their buddies and respect their diversity and individual perspectives: <ul> <li>Programming for Engineers</li> <li>Analog and Digital Electronics</li> <li>Principles of Electrical Engineering</li> </ul> </li> <li>Some module leaders, form groups where students are forced to work with random classmates in certain assignments and they are given a free choice to form groups for certain tasks.</li> <li>All teaching and learning materials are available as soft copies on the VLE in an appropriate accessible format. Module leaders also encourage students to approach them should they need the material in a different format. An example is notes with larger fonts for partially visually impaired students and printed material provided to DDS students.</li> </ul>
Assessment for learning	Assessment and feedback to support attainment, progression and retention Assessment is recognised as a critical point for at risk students as well as integral to the	The modules at L4 employ a range of course work assessments, categorised into formative or summative assessments that are integral to the learning and progression of all students.
	learning of all students. Formative feedback is essential during transition into university. All first semester modules at level 4 should include a formative or low-stakes summative assessment (e.g. low weighted in final outcome	Formative assessments are important in the early years of a student's journey on the course as this will provide an opportunity to quickly act on the formative feedback obtained and work to address weaknesses which then helps them to progressively gain better marks in the later part of that assessment and other assessments.

	for the module) to provide an early opportunity for students to check progress and receive prompt and useable feedback that can feed- forward into future learning and assessment. Assessment and feedback communicates high expectations and develops a commitment to <b>excellence</b> .	Also, due to the nature of the subjects studied, sometimes summative assessment are more suitable as it takes time for students to develop their understanding of complex concepts and then fully put them into practice or use, in either a classroom exercise or a work-place related case study. In situations where summative assessments are undertaken, formative feedback forms part of the scheduled contact time/meetings between the students and member of academic staff. Feedback for summative assessments is generally provided to students within the recommended timeframe as per the school/university regulations, which is currently 2 weeks after submission.
		Summative assessments contribute with a lower weighting, to the final module mark. The weightings can range from 5 to 50% depending on the number and type of assessment components that form part of the course work for that specific module.
High impact pedagogies	Research and enquiry experiences Opportunities for students to undertake small- scale independent enquiry enable students to understand how knowledge is generated and tested in the discipline as well as prepare them	Students on this course are required to undertake small-scale independent enquiry- based study and contribute to either their individual projects/task or to a group/team project that they are part of. The module Rail Industry-Professional Practice at L4 and Rail Engineering
	to engage in enquiry as a highly sought-after outcome of university study. In preparation for an undergraduate dissertation at level 6, courses should provide opportunities for students to develop research skills at level 4 and 5 and should engage with open-ended problems with appropriate support. Research opportunities should build student autonomy	Team Design Project at L5, facilitates such aspects for students to experience as part of their individual and team tasks and also as part of the major design challenge that all students on the module undertake. The design challenge is more of a cross disciplinary nature and required groups to be constituted with students from different pathways which allows them to work as an interdisciplinary team and enjoy the diversity of the team and raise to the challenging academic aptitude required.
	and are likely to encourage <b>creativity</b> and problem-solving. Dissemination of student research outcomes, for example via posters,	The Rail Engineering Team Design Project module at L5 also builds on the students experiences and competencies gained in their L4 study and facilitates the teams to work on an open-ended, academically challenging aspect within the students own discipline where they are required to work as a team to

	presentations and reports with peer review, should also be considered.	undertake research (both individually and as a team) and explore creative and innovative solutions. They are also then required to present their working formally to their peers and lecturers. They also experience writing of reflective reports and undertake peer review/assessments which are moderated by the academic in charge of the session/project/task/module. Students on this module also experience the use of disseminating their work and ideas, using a range of techniques like posters, presentations, sketches etc.
Curricula informed by employer and industry need / Assessment for learning	Authentic learning and assessment tasks Live briefs, projects or equivalent authentic workplace learning experiences and/or assessments enable students, for example, to engage with external clients, develop their understanding through situated and experiential learning in real or simulated workplace contexts and deliver outputs to an agreed specification and deadline. Engagement with live briefs creates the opportunity for the development of student outcomes including <b>excellence</b> , <b>professionalism</b> , <b>integrity</b> and <b>creativity</b> . A live brief is likely to develop research and enquiry skills and can be linked to assessment if appropriate.	Students are invited to talks by alumni and the industrial advisory panel members, who often share their experiences and current issues in the industry, through case studies or presentations, relevant to the courses and this will help develop the understanding of students where they are able to see how their classroom knowledge can be transformed to provide solutions to problems in workplace.
Inclusive teaching, learning and assessment	<u>Course content and teaching methods</u> <u>acknowledge the diversity of the student cohort</u> An inclusive curriculum incorporates images, examples, case studies and other resources from a broad range of cultural and social views reflecting diversity of the student cohort in terms of, for example, gender, ethnicity, sexuality, religious belief, socio-economic background	Due to the nature of the subject material, there will be little contribution based on cultural or social diversity among the students of the cohort. However, industry practices vary from country to country and since our student body is diverse and arrive from different countries, this then becomes contextual in their learning, for e.g. electrical earthing and bonding techniques/arrangements are traditionally different in different countries and are also industry specific, so what is applicable to land-based equipment is not relevant to off-shore equipment etc.

Г Г Г	ata. This commitment to <b>inclusivity</b> eachles	
	etc. This commitment to <b>inclusivity</b> enables	
	students to recognise themselves and their	
	experiences in the curriculum as well as foster	
	understanding of other viewpoints and	
	identities.	
Curricula	Work-based learning	Work-based learning is part of this course, and part-time students who currently
informed by	Opportunities for learning that is relevant to	work in related technical capacity will have the benefit of immediately putting

and industry	workplace setting are fundamental to	
needs	developing student applied knowledge as well	Assignments where possible are designed to be based on case studies, which
	as developing work-relevant student outcomes	are close to real world scenarios and guest talks often feed into these.
	such as networking, professionalism and	
	integrity. Work-based learning can take the	
	form of work experience, internships or	
	placements as well as, for example, case	
	studies, simulations and role-play in industry-	
	standards settings as relevant to the course.	
	Work-based learning can be linked to	
	assessment if appropriate.	
Embedded	Writing in the disciplines: Alternative formats	The course offers varying assessment aspects which supports students
learning	The development of student awareness,	attempts to adopt ways of thinking and practising, which is underpinned by
development	understanding and mastery of the specific	knowledge and skills gained, the formative feedback provided and the
development	thinking and communication practices in the	opportunities to put them into practice.
	discipline is fundamental to applied subject	
	knowledge. This involves explicitly defining the	Students also undertake a variety of presentation techniques; they are generally
	features of disciplinary thinking and practices,	required to assimilate information while performing a task in the laboratory or
	finding opportunities to scaffold student	during a group discussion and quickly note it down as a running commentary in
	attempts to adopt these ways of thinking and	a logbook for formal presentation. Further in their study, they are required to
	practising and providing opportunities to receive	retrieve data from the information recorded which enables them to experience
	formative feedback on this. A writing in the	their own strengths and weaknesses associated with their personal style of
	disciplines approach recognises that writing is	recording information.

	not a discrete representation of knowledge but integral to the process of knowing and understanding in the discipline. It is expected that assessment utilises formats that are recognisable and applicable to those working in the profession. These can be, project reports, presentations, posters, lab or field reports, journal or professional articles, white-papers, case reports, handbooks, or guides.	
High impact pedagogies	Multi-disciplinary, interdisciplinary or interprofessional group-based learning experiences Building on experience of group working at level 4, at level 5 students should be provided with the opportunity to work and manage more complex tasks in groups that work across traditional disciplinary and professional boundaries and reflecting interprofessional work-place settings. Learning in multi- or interdisciplinary groups creates the opportunity for the development of student outcomes including <b>inclusivity</b> , communication and networking.	Most of the students on these rail courses are predominantly from Network Rail, however they work in teams on lab-based exercises, which are usual from L4 to L6, or on specific group tasks as part of the modules that contribute to the development of soft skills at L4/L5. This is further strengthened when they undertake an interdisciplinary Professional Practice module at L4 and Team Design Project module at L5 where the culmination of all the knowledge, skills, experiences, is expected to shape the outputs which requires strong inclusivity, communication and networking skills, to bring out the potential of each team member to the maximum benefit of the team.
Assessment for learning	<u>Variation of assessment</u> An inclusive approach to curriculum recognises diversity and seeks to create a learning environment that enables equal opportunities for learning for all students and does not give those with a particular prior qualification (e.g. A- level or BTEC) an advantage or disadvantage.	The diversity and entry qualifications of the cohorts are considered when setting assessment which are approved by external examiners and are overseen by academic quality review processes, both through LSBU's internal reviews as well as period review at times of accreditation by the professional body.

	A holistic assessment strategy should provide opportunities for all students to be able to demonstrate achievement of learning outcomes in different ways throughout the course. This may be by offering alternate assessment tasks at the same assessment point, for example either a written or oral assessment, or by offering a range of different assessment tasks across the curriculum.	Variation to standard agreed assessments are possible but should be approved by the relevant external examiner and relevant professional body accrediting the course, the IET in this case.
Curricula informed by employer and industry need	<u>Career management skills</u> Courses should provide support for the development of career management skills that enable students to be familiar with and understand relevant industries or professions, be able to build on work-related learning opportunities, understand the role of self- appraisal and planning for lifelong learning in career development, develop resilience and manage the career building process. This should be designed to inform the development of <b>excellence</b> and <b>professionalism</b> .	<ul> <li>This course provides opportunities and support to enable students to gain general employability skills that are complemented with the help from the university's employability office (such as career planning, Career fairs etc.).</li> <li>Specific employability skills (few listed here) that are directly relevant to the industry are also developed as part of the course:</li> <li>In the programming or Autocad modules students are taught and trained to used CAD packages which are widely used in the industry and is an important competency to add to their CV. Students in this course are trained in working with PCB designs of electronic circuits as part of Design and Practice.</li> </ul>

#### Appendix C: Personal Development Planning

Personal Development Planning (PDP) is a structured process by which an individual reflects upon their own learning, performance and/or achievement and identifies ways in which they might improve themselves academically and more broadly. Course teams are asked to indicate where/how in the course/across the modules this process is supported.

Approach to PDP	LEVEL 4	LEVEL 5
1 Supporting the development and recognition of skills through the personal tutor system.	All students are allocated a personal tutor– coordinated by the Senior Personal Tutor. Personal tutoring is embedded in the level 4 module, Design and Practice where students are given the opportunity to learn about the role of the personal tutor. Students can request or book a slot to see their personal tutors. Induction course, including: 1. Meeting with personal tutor 2. Use of library and learning resources (LIS) 3. Use of University IT facilities/Blackboard VLE 4. Study skills. 5. Access to University support facilities. 6. Induction to 'Don't Panic' – PDP for L4.	Induction for direct entry students. See Level 4
2 Supporting the development and recognition of skills in academic modules/modules.	Most modules have practical elements, and this requires keeping a laboratory log book for each module. This occurs across all levels of the course, but particular emphasis is placed on this aspect at L4 as logbooks provide a platform for further skills development such as report writing, dissertations and project management occurring at Levels 5, and 6. The following L4 modules have generic skills components, including keeping a laboratory logbook, team-working, planning and managing study: Mathematics, Design and Practice, Electronic principles, Electrical Circuit Analysis. In the core mathematics module practice is encouraged by continuous assessment and feedback (weekly) of tutorial logbooks. Enhanced Maths tutorials – additional support is provided for mathematics to improve basic skills for those students with diverse entry qualifications.	Following on from L4 students continue the practice of keeping logbooks but this is now complemented in technical modules at L5 by writing formal laboratory reports which requires other skills such as information retrieval and processing and IT skills. This aspect is featured in the following modules: Professional Practice L4, Team Design Project L5, and Rail Systems Engineering L5.

3 Supporting the development and recognition of skills through purpose-designed modules.	Design and Practice plus Professional Practice and Team Design Project – these modules aim to introduce and develop the skills needed by professional engineers to enable them to make use of their technical knowledge, in particular: • Develop students' technical communications, basic report writing and team-working skills• Develop students' skills in project planning and management• Develop students' confidence in undertaking self-managed practical projects. CV writing, evaluation and interview techniques	Professional Practice L4 and Team Design Project L5 prepares students for their role as professional engineers in a number of ways, including: • Detailed study of project planning and networking techniques• Planning and preparation for the major project at L6• Introduction to systems thinking
---	--	--

4 Supporting the development and recognition of skills through research projects and dissertation work.	A team project in Design and Practice concentrates on the processes necessary to produce and market an electronic product.	Mini-projects, assignments and dissertations are featured in a number modules at L5, and Team Design Project module specifically tasks a team of students to take a project from requirements through to design solution within their selected degree discipline.
---	--	---

5 Supporting the development and recognition of career management skills.	Students have an introduction to the engineering profession and professional bodies	Not Relevant for these students as apprentices are already in relevant employment.
6 Supporting the development and recognition of career management skills through work placements or work experience.	CDs make students aware of potential sandwich placements.	Not Relevant for these students as apprentices are already in relevant employment and the levy funding means they cannot take a year out for exchange programs.

7 Supporting the development of skills by recognising that they can be developed through extracurricular activities.	The Skills for Learning Centre gives talks to student cohorts to encourage individuals to join the University Student Ambassadors scheme and the Mentoring scheme in local schools. The university maintains a VLE module site Skills for Learning Online including information about professional bodies and this is open to all students throughout their course. Students are encouraged to start their own 'clubs' and laboratory facilities and specific notice-boards are made available for this.	Not Relevant for these students as apprentices are already in relevant employment and the levy funding means they cannot take a year out for exchange programs.
8 Supporting the development of the skills and attitudes as a basis for continuing professional development.	Students are encouraged to join the relevant professional body for the course. We run sessions where IET visits and gives talks to students about the impact for their careers of joining professional bodies. The division pays the IET membership for 5 years to all enrolled studetns.	See L4
9 Other approaches to personal development planning.		

10 The means by which self- reflection, evaluation and planned development is supported e.g. electronic or paper-based learning log or diary.	See L4. The logbook may form part of the coursework in some modules, but this is supplemented by formal reports, mini-projects, and dissertations in most technical modules.
---	--

#### Appendix D: Terminology

[Please provide a selection of definitions according to your own course and context to help prospective students who may not be familiar with terms used in higher education. Some examples are listed below]

awarding body	a UK higher education provider (typically a university) with the power to award higher education qualifications such as degrees
bursary	a financial award made to students to support their studies; sometimes used interchangeably with 'scholarship'
collaborative provision	a formal arrangement between a degree-awarding body and a partner organisation, allowing for the latter to provide higher education on behalf of the former
compulsory module	a module that students are required to take
contact hours	the time allocated to direct contact between a student and a member of staff through, for example, timetabled lectures, seminars and tutorials
coursework	student work that contributes towards the final result but is not assessed by written examination
current students	students enrolled on a course who have not yet completed their studies or been awarded their qualification
delivery organisation	an organisation that delivers learning opportunities on behalf of a degree-awarding body
distance-learning course	a course of study that does not involve face-to-face contact between students and tutors
extracurricular	activities undertaken by students outside their studies
feedback (on assessment)	advice to students following their completion of a piece of assessed or examined work
formative assessment	a type of assessment designed to help students learn more effectively, to progress in their studies and to prepare for summative assessment; formative assessment does not contribute to the final mark, grade or class of degree awarded to students

higher education provider	organisations that deliver higher education
independent learning	learning that occurs outside the classroom that might include preparation for scheduled sessions, follow-up work, wider reading or practice, completion of assessment tasks, or revision
intensity of study	the time taken to complete a part-time course compared to the equivalent full-time version: for example, half-time study would equate to 0.5 intensity of study
lecture	a presentation or talk on a particular topic; in general lectures involve larger groups of students than seminars and tutorials
learning zone	a flexible student space that supports independent and social earning
material information	information students need to make an informed decision, such as about what and where to study
mode of study	different ways of studying, such as full-time, part-time, e-learning or work-based learning
modular course	a course delivered using modules
module	a self-contained, formally structured unit of study, with a coherent and explicit set of learning outcomes and assessment criteria; some providers use the word 'course' or 'course unit' to refer to individual modules
national teaching fellowship	a national award for individuals who have made an outstanding impact on student learning and the teaching profession
navigability (of websites)	the ease with which users can obtain the information they require from a website
optional module	a module or course unit that students choose to take
performance (examinations)	a type of examination used in performance- based subjects such as drama and music
professional body	an organisation that oversees the activities of a particular profession and represents the interests of its members
prospective student	those applying or considering applying for any programme, at any level and employing any mode of study, with a higher education provider

regulated course	a course that is regulated by a regulatory body
regulatory body	an organisation recognised by government as being responsible for the regulation or approval of a particular range of issues and activities
scholarship	a type of bursary that recognises academic achievement and potential, and which is sometimes used interchangeably with 'bursary'
semester	either of the parts of an academic year that is divided into two for purposes of teaching and assessment (in contrast to division into terms)
seminar	seminars generally involve smaller numbers than lectures and enable students to engage in discussion of a particular topic and/or to explore it in more detail than might be covered in a lecture
summative assessment	formal assessment of students' work, contributing to the final result
term	any of the parts of an academic year that is divided into three or more for purposes of teaching and assessment (in contrast to division into semesters)
total study time	the total time required to study a module, unit or course, including all class contact, independent learning, revision and assessment
tutorial	one-to-one or small group supervision, feedback or detailed discussion on a particular topic or project
work/study placement	a planned period of experience outside the institution (for example, in a workplace or at another higher education institution) to help students develop particular skills, knowledge or understanding as part of their course
workload	see 'total study time'
written examination	a question or set of questions relating to a particular area of study to which candidates write answers usually (but not always) under timed conditions
