| Distinctive features of course | in the marketplac and supported by focus on sustain and urban trans London location companies. St specific skills do motorsport indus Students will stud BEng Mechanica provide a funda subjects. In Yea vehicle related a of the course stu Engineering mod IMechE Formula | Eng Advanced Vehicle Engineering courses are unique ce, delivered through innovative project based learning y industry leading hardware and software. The courses nable development, future low-emission technologies sportation benefitting from LSBU's inner-city central n, and links with local leading Vehicle Engineering cudents will develop expertise, knowledge, and the emanded by leading automotive, future vehicle and stry. | | |
| The course provides students with the opportunity to stu Vehicle Engineering to a level consistent with accredi IMechE as a route to Chartered Engineer status, whilst applied work and hands-on involvement through the many available. LSBU is creating a world-class Advar Engineering facility to support these courses and meet the Automotive, future Low-carbon Vehicle and Motorsport in | | | | |
| | Placements are encouraged in both cours range of placements based on industry cours / tyre suppliers, and Motorsport, and Lond | | | |
| | aiming for Charte complete a se | ear (Year 4) on the MEng course, will enable students ered Engineer status (CEng) to do so without having to parate accredited Masters degree course, or any nuing Professional Development (CPD). | | |

| Course Aims | The MEng Advanced Vehicle Engineering course aims to: |
|-------------|--|
| | Encourage students to acquire a deeper understanding of the essential facts, concepts, theories and principles of Advanced Vehicle Engineering and its underpinning science and mathematics. Many recruiters will look favourably on BEng graduates for this reason. |
| | Graduates for this reason. Graduates for this reason. Graduates from this course will have the following knowledge, skills, abilities and characteristics: Committed and able to follow a career in Vehicle Engineering allowing partial progression to Chartered Engineer professional status. Awareness of best current practice within industry, and future trends. Industry-critical skills such as working effectively as part of a team and/or providing the leadership for the team. Effective communication skills enabling the exchange of ideas with specialist professionals and with the public at large. Continual Professional Development (CPD) skills including critical self-awareness, reflection, independent judgement, responsibility for decisions, original thinking, managing own learning and making use of scholarly reviews and primary sources. Systematic and broad understanding of the key topics within Vehicle Engineering together with the skills needed to update, extend and deepen in further study and future career development. Understanding of a cognitive map of topics within the Vehicle Engineering subject area incorporating knowledge and understanding of core Mechanical Engineering topics such as Dynamics, Thermofluids, Mechanics of Solids, and Manufacturing and Materials underpinned by understanding of relevant science and engineering topics such as Mathematics, Statics, Materials Science, Computing and Control Systems. Ability to analyse Vehicle Engineering components and systems from first principles, through to advanced simulation techniques. Understand the advantages and disadvantages of different analysis approaches, and be able to select an appropriate method. Competent practical skills including basic manufacturing and instrumentation techniques to inform design choices. Ability to set up projects and manage them, approach design problems with creativity and see all tasks to successful completion |
| | Value of a MEng programme This programme extends students studies to Masters level, advanced- level study and provides students with greater breadth and depth of study which is the most direct route to become a Chartered Engineer (CEng). After the completion of this programme students can immediately pursue the necessary steps to obtain Chartered engineer |

| | status which enhances employability and offers higher salaries. Employers are keen on MEng graduates. Students can apply for undergraduate student funding for this course, so can gain a postgraduate level qualification without the financial pressures normally associated with further study. In addition to the aims of the BEng Advanced Vehicle Engineering course, graduates enrolled on the MEng course will have the following additional knowledge, skills, abilities and characteristics: Committed and able to follow a career in Vehicle Engineering allowing full progression to Chartered Engineer professional status. Further development of Industry-critical skills such as working effectively as part of a team and/or providing the leadership for the team. Integration into a multi-disciplinary engineering team, demonstrating competence in a variety of roles. Further develop a wider appreciation of the economic. Legal, social and ethical, environmental context of vehicle engineering, and the vehicle product lifecycle. Detailed knowledge and understanding of the key topics within Vehicle Engineering extend and deepen in further study and future career development. Provide the skills and experience for the student to undertake specialist roles in Industry, or further academic research. Awareness of technology at the forefront of Advanced Vehicle Engineering, and its benefits in vehicle design and analysis. |
|-----------------------------|---|
| Course Learning Outcomes | The defined learning outcomes that are used in this course specification are those published by the Engineering Council in the UK standard for Professional Engineering Competence (UK-SPEC). |
| | A) Students will have knowledge and understanding of: |
| | A1: Knowledge and understanding of scientific principles and methodology necessary to underpin their education in mechanical and related engineering disciplines, to enable appreciation of its scientific and engineering context, and to support their understanding of relevant historical, current and future developments and technologies A2: Knowledge and understanding of mathematical and statistical methods necessary to underpin their education in mechanical and related engineering disciplines and to enable them to apply mathematical and statistical methods, tools and notations proficiently in the analysis and solution of engineering problems A3: Ability to apply and integrate knowledge and understanding of other engineering disciplines A4: Understanding of engineering principles and the ability to apply them to analyse key engineering processes |

| A5: Ability to identify, classify and describe the performance of systems and components through the use of analytical methods and modelling techniques |
|---|
| A6: Ability to apply quantitative and computational methods in order to solve engineering problems and to implement appropriate action |
| A7: Understanding of, and the ability to apply, an integrated systems approach to solving engineering problems |
| Enhanced MEng learning outcomes: A8: A comprehensive knowledge and understanding of the scientific principles and methodology necessary to underpin their education in mechanical and related engineering disciplines, and an understanding and know-how of the scientific principles of related disciplines, to enable appreciation of the scientific and engineering context, and to support their understanding of relevant historical, current and future developments and technologies. |
| A9: Knowledge and understanding of mathematical and statistical methods necessary to underpin their education in mechanical and related engineering disciplines, and to enable them to apply a range of mathematical and statistical methods, tools and notations proficiently and critically in the analysis and solution of engineering problems. |
| A10: Ability to apply and integrate knowledge and understanding of other engineering disciplines to support study of mechanical and related engineering disciplines and the ability to evaluate them critically and to apply them effectively. |
| A11: Awareness of developing technologies related to mechanical engineering. |
| A12 : A comprehensive knowledge and understanding of mathematical and computational models relevant to mechanical engineering, and an appreciation of their limitations. |
| A13: Understanding of concepts from a range of areas, including some outside engineering, and the ability to evaluate them critically and to apply them in engineering projects. |
| A14: Understanding of engineering principles and the ability to apply them to undertake critical analysis of key engineering processes. |
| A15: Ability to apply quantitative and computational methods, using alternative approaches, and understanding their limitations, in order to solve engineering problems and implement action. |
| A16: Understanding of, and the ability to apply, an integrated or systems approach to solving complex engineering problems. |
| A17: Ability to use fundamental knowledge to investigate new and emerging technologies. |

| Ado. Ability to avtract and avaluate participant data and to apply |
|---|
| A18: Ability to extract and evaluate pertinent data and to apply engineering analysis techniques in the solution of unfamiliar problems. |
| B) Students will develop their intellectual skills such that they are able: |
| B1: Understand and evaluate business, customer and user needs, including considerations such as the wider engineering context, public perception and aesthetics |
| B2: Investigate and define the problem, identifying any constraints including environmental and sustainability limitations; ethical health, safety, security and risk issues; intellectual property; codes of practice and standards |
| B3: Work with information that may be incomplete or uncertain and quantify the effect of this on the design |
| B4: Apply advanced problem-solving skills, technical knowledge and understanding, to establish rigorous and creative solutions that are fit for purpose for all aspects of the problem including production, operation, maintenance and disposal |
| B5: Plan and manage the design process, including cost drivers, and evaluate outcomes |
| B6: Communicate their work to technical and non-technical audiences |
| B7: Understanding of the need for a high level of professional and ethical conduct in engineering and a knowledge of professional codes of conduct |
| B8: Knowledge and understanding of the commercial, economic and social context of engineering processes |
| B9: Knowledge and understanding of management techniques, including project management, that may be used to achieve engineering objectives |
| B10: Understanding of the requirement for engineering activities to promote sustainable development and ability to apply quantitative techniques where appropriate |
| B11: Awareness of the relevant legal requirements governing engineering activities, including personnel, health & safety, contracts, intellectual property rights, product safety and liability issues |
| B12: Knowledge and understanding of risk issues, including health & safety, environmental and commercial risk, and of risk assessment and risk management techniques |
| Enhanced MEng learning outcomes: |

| B3: Work with information that may be incomplete or uncertain, quantify the effect of this on the design and, where appropriate, use theory or experimental research to mitigate deficiencies. |
|--|
| B7: Understanding of the need for a high level of professional and ethical production in engineering, a knowledge of professional codes of conduct, and how ethical dilemmas can arise. |
| B13: Demonstrate wide knowledge and comprehensive understanding of design processes and methodologies and the ability to apply and adapt them in unfamiliar situations. |
| B14: Demonstrate the ability to generate an innovative design for products, systems, components or processes to fulfil new needs |
| B9: Knowledge and understanding of management techniques, including project and change management, that may be used to achieve engineering objectives, their limitations, and how they may be applied appropriately. |
| B10: Understanding of the requirement for engineering activities to promote sustainable development and ability to apply quantitative techniques where appropriate. |
| B11: Awareness of the relevant legal requirements governing engineering activities, including personnel, health & safety, contracts, intellectual property rights, product safety and liability issues, and an awareness that these may differ internationally. |
| B12: Knowledge and understanding of risk issues, including health & safety, environmental and commercial risk, risk assessment and risk management techniques, and an ability to evaluate commercial risk. |
| B15: Understanding of the key drivers for business success, including innovation, calculated commercial risks and customer satisfaction. |
| C) Students will acquire and develop practical skills such that they are able to: |
| C1: Understanding of contexts in which engineering knowledge can be applied (e.g. operations and management, application and development of technology, etc.) |
| C2: Knowledge of characteristics of particular materials, equipment, processes or products |
| C3: Ability to apply relevant practical and laboratory skills |
| C4: Understanding use of technical literature and other information sources |
| C5: Knowledge of relevant legal and contractual issues |
| |

| D5: Monitor and adjust a personal programme of work on an on-going basis |
|---|
| Enhanced MEng learning outcome: |
| D4: Exercise initiative and personal responsibility, which may be as a team member or leader |
| D3: Plan and carry out a personal programmes of work, adjusting where appropriate |
| D2: Plan self-learning and improve performance, as the foundation for lifelong learning/CPD |
| D1: Apply their skills in problem solving, communication, information retrieval, working with others and the effective use of general IT facilities |
| D) Students will acquire and develop transferrable skills such that they are able to: |
| C13: A thorough understanding of current practice and its limitations, and some appreciation of likely new developments. |
| C11: Understanding of different roles within an engineering team and the ability to exercise initiative and personal responsibility, which may be as a team member or leader. |
| C10: Ability to apply engineering techniques taking account of a range of commercial and industrial constraints. |
| Enhanced MEng learning outcomes: C2: Knowledge of characteristics of particular materials, equipment, processes or products, with extensive knowledge and understanding of a wide range of engineering materials and components. |
| C9: Understanding of, and the ability to work in, different roles within an engineering team |
| C8: Ability to work with technical uncertainty |
| C7: Awareness of quality issues and their application to continuous improvement |
| C6: Understanding of appropriate codes of practice and industry standards |

Knowledge and Understanding: Graduates must be able to demonstrate their knowledge and they must have an appreciation of the wider multidisciplinary engineering context and its underlying principles. They must

appreciate the social, environmental, ethical, economic and commercial considerations affecting the exercise of their engineering judgement.

Teaching and learning Strategies:

Acquisition of knowledge and understanding is covered through lectures, associated handouts and supporting material on the Virtual Learning Environment (VLE). Lectures, tutorials and laboratory practical's include analysis and/or design methods for which problems will be set to enhance students learning, supported by associated problem-solving sessions, which reinforce the lecture content. Tutorials, coursework and tests provide written or verbal feedback to enhance and develop students learning. There is a substantial amount of self-directed learning through individual and/or group project work. The course is designed to provide a broad foundation in mechanical engineering with emphasis on theory, analysis, and design. The course also develops analytical and applied skills that will enable students to analyse, design and test engineering principles.

Intellectual Abilities:

Graduates must be able to apply appropriate quantitative science and engineering tools to the analysis of problems. They must be able to demonstrate creative and innovative ability in the synthesis of solutions and in formulating designs. They must be able to comprehend the broad picture and thus work with an appropriate level of detail.

Teaching and learning Strategies:

Acquisition of Intellectual Skills is developed through lectures, tutorial, individual and team problem-based work. In private study, students will develop skills by writing laboratory reports, and tackling problems set by the tutor/laboratory instructor, or in past examinations and projects. Laboratory sessions are embedded in modules and projects, where students are taught the appropriate tools to solve engineering problems. The course teaches skills which span the mechanical engineering field, and are fundamental to engineering to effectively organise information and manage design complexity. Familiarity with the taught mechanical engineering skills, the ability to deploy them in appropriate situations, and the ability to use them effectively are important Intellectual Abilities. There are strong numerical, analytical and design skills across the course, which develop ideas from research and development activities. Acquisition of Intellectual Abilities is also gained through the specialist final year modules as well as the final year individual project. Students are encouraged to attend the seminars/events such as those organised by the School of Engineering and to attend presentations from invited speakers on relevant mechanical engineering topics. MEng level teaching and learning carries this a stage further by challenging students to cope with tasks that are broad in scope and detailed in context, making them very complex.

Practical skills:

Graduates must possess practical engineering skills acquired through, for example, work carried out in laboratories and workshops; in industry through supervised work experience; in individual and group project work; in design work; and in the development and use of computer software in design, analysis and control. Evidence of group working and of participation in a major project is expected. However, individual professional bodies may require particular approaches to this requirement.

Teaching and learning Strategies:

Acquisition of Practical Skills is acquired during the practical laboratory sessions. Students will learn to record laboratory activity to document and keep track of all design activities, conducted experiments, and measured/observed results. The laboratory experience, in most of the modules, should also assist students in learning practical issues such as: proper use of computers and test equipment, building and testing prototypes, understanding processes

and issues associated with product development. Laboratory experiences capitalise on providing a foundation for other important elements of practical activities. The course offers carefully planned practical assignments in a laboratory setting which help students develop confidence in their technical ability. Laboratory experiences will help students develop the expertise needed to build new products. Engineering laboratory exercises allow students to develop skills in theory, calculations, design, and testing. Further development of these skills is acquired in the final year individual project.

General transferable skills:

Graduates must have developed transferable skills that will be of value in a wide range of situations. These are exemplified by the Qualifications and Curriculum Authority Higher Level Key Skills and include problem solving, communication, and working with others, as well as the effective use of general IT facilities and information retrieval skills. They also include planning self-learning and improving performance, as the foundation for lifelong learning/CPD.

Teaching and learning Strategies:

Acquisition of General Transferable Skills is achieved through communication of knowledge in formal reports. These constitute a part of the assessment for most modules on the course. One aspect of this is ensuring that students possess a set of transferable skills such as communication, teamwork, and presentation skills. Students can use these skills in any occupation and can convey from one type of work to another without re-training. Additionally, students acquire library and research skills as well as professional skills such as time management, project management, information literacy, information management, career development, self-awareness, and keeping up-to-date with innovations in the field. From a motivational perspective, students receive formative feedback on these skills in the context of mechanical engineering and in a way that highlights their relevance and importance to the discipline.

Overview of teaching and learning activities:

This includes lectures, guest lectures from industry, tutorials, practical workshop classes, practical laboratory experiments and field trips. The course is made up of several modules (see section G below) and each module is delivered through a combination of lectures, tutorials, practical workshops, etc. all of which amounts to directed teaching (classroom contact). There is a variance in the makeup of the number of hours dedicated to lectures, workshops etc. but the total number of study hours attached to each module is dependent on the module weighting in credits. Typically, a 20-credit module is attached to 200 hours of learning which constitutes both directed learning and independent learning (1 credit is equal to 10 hours). This is split between contact time and independent learning. Generally, this equates to a maximum of 78 hours of contact time per module, and 122 hours of independent learning time.

Further, teaching and learning in this course ensures that graduates have the capacity to meet the needs of employers, producing graduates who are prepared to move into employment with skills and expectations that benefit their employers. Graduates must be able to keep abreast with changes, and a key requirement of this course is equipping students with the mechanisms for achieving this. Lifelong learning is considered in this course, which can foster such attitudes with novel approaches to teaching and learning that continually question and challenge situations and by highlighting opportunities for advances. Final year modules, including the individual project, can challenge students by exercises that seek to explore new avenues.

Subject-related and Generic Resources:

These include the Perry Library, the metalwork and woodwork workshops, the rapid prototyping laboratories, the thermodynamics laboratory, the solid mechanics laboratory, the advanced vehicle engine test laboratory, and computer labs.

The core and optional reading lists are supplied at the end of each module guide produced by the module leader. A copy of the module guide will be made available on the Virtual Learning Environment, VLE (Moodle) and the reading lists can also be accessed through LSBU's Library website.

Overview of learning support:

To support students in their learning, academic and support staff are available during the normal operating hours of the University via prior appointment. Academic staff also operate surgery hours where no prior appointments are needed. The University buildings and library are open from 8am to 9pm during term time, while the library operates for an extended period during examinations. Some specialist workshops/computing spaces etc. are not accessible outside the normal operating hours of 9am to 5pm, unless timetabled for use in a module. Teaching sessions for PT students may run until 9pm at the latest and the relevant and required areas are open for access as timetabled.

All students are allocated to a Personal tutor when they begin their study at LSBU and the personal tutor is the one who students would typically see about any problems or issues they face; not just academic ones (most academic problems will probably be dealt with by module teachers or Course Directors). Students are advised to establish contact with their personal tutor from the beginning of their studies, evidenced by keeping a record of at least two meetings per semester. Students are briefed about the tutoring systems during the enrolment and orientation process and during the Design and Practice module.

The LSBU Skills for Learning Centre offers students a range of interactive workshops, one-to-one tutorials and drop-in sessions delivered by experienced learning developers. It also offers Language support for international students. Students who struggle to understand some of the basics, or feel they need additional support in understanding fundamentals of mathematics, are advised to use the drop-in sessions where they can provide comprehensive advice and guidance.

Teaching Staff:

Most modules are delivered by full-time academic staff from within the parent division where the course resides and or sometimes by staff from other areas within the School of Engineering or University where expertise lies. The primary aim is that each module is taught by a single member of staff, which most likely is the module leader (support teaching may be needed depending on the nature/size of the module etc. where students are sub grouped into multiple tutorials or laboratory sessions). Occasionally, PG students or part-time teaching or research staff may support certain sessions, and, in such cases, the relevant tutors are trained, and care is taken to ensure the quality of the provision.

Virtual Learning Environment (VLE):

Each course has a course site on the VLE, where relevant information is posted by the respective Course Director. Each module on the course has a Module site on the VLE and all relevant teaching and learning material such as module guides, lecture notes, teaching slides, tutorial and seminar sheets, workshop exercises, past exam papers, assignments, supplement material etc. are made available by the module leader. The virtual learning environment (Moodle) can be accessed using the Windows OS login credentials and can be accessed from any Internet connected PC inside or outside of the LSBU campus.

D. Assessment

Assessment Overview:

University keeps an assessment and examinations procedure; a current version can be accessed at http://www.lsbu.ac.uk/__data/assets/pdf_file/0010/84349/assessment-and-examination-

<u>procedure.pdf</u>. Coursework in modules can be either formative or summative and the details are usually made available in the module guide and explained to students by the module leader at the beginning of the semester. The module guide will also provide details about the weightage of these assessment components and when the relevant brief will be made available, including submission instructions and deadlines.

Formative assessment and feedback is part of the learning process on the course that provides constructive feedback to the learner. This allows students to improve their quality of work. It does not contribute towards a final module grade. All modules will provide students opportunities to receive formative assessment and feedback. Formative assessment typically includes discussions in the classroom, during tutorial exercises, simulation exercises, workshop or computing exercises, questions and answer sessions, peer discussions, observations, reflection on learning, presentation rehearsals.

Summative assessment and feedback is the process of evaluating learning at the conclusion of a module. Summative assessments include standardised tests delivered by examination, and coursework submissions. The course delivers both types of assessment used by the course. Normally, as a summative assessment, Students sit an end-of-semester examination in the form of a 2 or 3-hour unseen paper, or coursework assignments. Approximately 50% of the assessment on the course is via coursework. See Section H for individual modules. To pass a module, students must obtain an overall module mark of no less than 40% and a minimum threshold mark of 30% in each component.

Knowledge and Understanding:

The assessment strategy for Knowledge and Understanding is through examinations, mini tests, practical work using logbooks, assignments and formal reports, which frequently demand that the student extend knowledge of a subject by self-learning (A1 and A8). Emphasis is made on producing a design component in assignments as well as written examinations (A2 and A9). The ability to apply and integrate knowledge is assessed by larger scale project work as well group assignments and logbooks. Additionally in written examinations, emphasis is placed on producing conceptual design solutions to projects (A3 and A10). Engineering analysis skills in applying the knowledge and understanding are assessed formatively in tutorials (A4 and A14). The more extended skills are assessed via assignments and project reports summatively. Modules at levels 5 and 6 have progressively more design-based and systems analysis questions in examinations (A5, A16, A17 and A18). At level 6, the Individual Project assesses students ability to demonstrate how to apply a systems approach to solving engineering problems. At levels 5 and 6, laboratory workshops and assignments are often based on analysing systems performance in modules such as Thermofluids and sustainability among others (A6 and A7). Additional MEng level learning outcomes are assessed through analytical-based problems in coursework and examination at level 7 (A11, A12 and A13). Higher-level mathematical modelling and simulation skills are assessed by coursework assignments and logbooks (A15).

Intellectual Skills:

The assessment strategy for Intellectual Skills is through presentations and also formal reports at various stages of project work. Innovation and design skills are assessed by group work as well as a formal report. Formative and summative assessments in 'design and make' exercises are via standard logbooks, coursework exercises, in-class exercises and phase tests in the early modules. Further development of these skills is more indirectly assessed, since significant achievement in these areas is necessary for the highest marks in project work, which includes assessment by presentation and viva-voce examinations (B1 and B12). Practical laboratory sessions and software workshops provide a means to assess this through assignments, logbooks and in-class phase tests. Examinations are also used to challenge students to design a system based on specific user requirements. Students are encouraged to make design assumptions in order to demonstrate their understanding of the importance of requirements specification (B2, B6, B8 and B9). Modules that have a strong design component are assessed by design assignment reports

at different levels across (B3, B10 and B11). Some modules specifically employ practical simulation exercises as a major part of the assessment, including engineering reports and presentations. Project management plays a primary role in assessment of the major Level 6 Individual Project, both in an initial progression report and in the final report which has to describe the projects process activity, including presentation session and viva-voce examination (B4, B5 and B12).

Practical Skills:

The assessment strategy for Practical Skills is generally via log books, coursework assignments and the level 6 individual project of which include a presentation and a viva voce examination. Lab exercises, tutorial assignments are assessed specifically via standard logbooks and reports based on laboratory activity (C1 and C2). Design assignments are used to assess C3 and C4 where students are required to provide background information as well as suitable referencing for their assignment. Simple 'design and make' exercises are used to assess C5, C6 and C8 which also get students to demonstrate the ability to work with technical uncertainty. Further development of these skills is indirectly assessed through design assignments in specialist modules at Levels 6. Additionally these are assessed in the Level 6 individual project of which include assessment by presentation and viva-voce examinations and various reports (C6, C7 and C9). The individual and Level 7 group project specifically assesses C11b where students are requested to project costing and payback calculations as part of feasibility studies.

General Transferable Skills:

The assessment strategy for General Transferrable Skills is to focus on employability-related activities such as formal reports, presentations and viva voce examinations of the L6 individual project. Exams, coursework report and project reports are used to assess D1 and D3. Personal Development Planning coursework specifically assesses D2. Onus is made on the use of individual and group presentations to assess students' ability in demonstrating D4.

E. Academic Regulations

The University's Academic Regulations apply for this course.

School specific protocols apply, including compliance with professional, statutory and regulatory bodies' requirements.

Course specific protocols:

Students enrolled onto the MEng course may be offered an opportunity to transfer to the BEng course, after completing level 4 or 5, if they fulfil any of the following criteria:

- 1. The overall average of their L4 modules is equal to or less than 54%
- 2. The overall average of their L5 modules is equal to or less than 54%
- 3. The student has repeated L4 or L5 due to not passing at their first attempt.

F. Entry Requirements

In order to be considered for entry to the course applicants will be required to have the following qualifications:

Full-time students

- A Level ABB or;
- BTEC National Diploma DDD or;
- Access to HE qualifications with 39 Distinctions and 6 Merits including 3 distinctions in Maths and 3 merits in Physics **or**;

- Equivalent level 3 qualifications worth 144 UCAS points
- Applicants must hold 5 GCSEs A-C including Maths and English or equivalent (reformed GCSEs grade 4 or above).

We welcome qualifications from around the world. English language qualifications for international students: IELTS score of 6.0, TOFEL-550 (print-based), TOFEL-80 (internet based), Cambridge Proficiency or Advanced Grade C.

Part-time students

- A Level AAB or;
- BTEC National Diploma DDD or;
- Access to HE qualifications with 39 Distinctions and 6 Merits including 3 distinctions in Maths and 3 merits in Physics **or**;
- Equivalent level 3 qualifications worth 144 UCAS points
- Applicants must hold 5 GCSEs A-C including Maths and English or equivalent (reformed GCSEs grade 4 or above).

Students interested in the course may be invited to an open day event where they will be possibly interviewed, and asked to show and discuss their experience and/or of portfolio.

Accredited Prior Experiential Learning

APEL may be taken into account in determining the entry requirements for candidates with relevant work experience, but cannot replace the requirement for formal qualifications in Mathematics.

Direct Entry

Applicants may be considered for entry to the second year of the course. Applicants will be interviewed and will be required to have formal qualifications at level 4, to demonstrate preparedness for direct entry.

G. Course structure(s)

Course overview

MEng Advanced Vehicle Engineering – Full time

- The course is based on two semesters per academic year. The MEng Scheme is offered in full-time (4 year) mode, with further options of sandwich industrial training (5 year), and year in Europe.
- The BEng schemes are similar but of one year less duration.
- Selection for the MEng route occurs at the end of year 2, at which point students are expected to have passed all modules and have achieved an average mark of not less than 55% without benefits of compensated passes.
- The sandwich year alternatives involve a one year placement away from the School between the second and third years of academic study.

| | Semester 1 | | Semester 2 | |

| Year 6 | Group Project | | | 40 credits |
| | Engineering Design Analysis and Manufacture | | | |

Placements information

We work within LSBU's Student Placement procedure guidelines and practices.

An optional Industrial placement (or sandwich year) is available to all students following successful completion of Level 5. An Industrial Placement does not contribute to the final degree award.

Students undertaking an Industry Placement will be enrolled onto a Placement Module and will be requested to submit evidence of their placement at the end of the year; including a daily logbook. Students on an Industrial Placement will be visited once per semester, if possible, by a member of the teaching team, or by their Personal Tutor.

The university has a centralised Employability Service that works alongside the Schools to deliver a placement offer to students. This year they have created a dedicated Placement team that deliver pre and post placement workshops to students alongside supporting them secure a placement and all compliance.

Procedure and check for suitability:

Requiring students to complete a 'placement confirmation form'.

Returning the form to the placements inbox: <u>ss-placements@lsbu.ac.uk</u> at least two weeks prior to the start of the placement.

The placement officer will contact the placement provider for confirmation and to carry out any due diligence / health and safety checks / check for suitability.

Students cannot begin the placement until they have received an approval email for the placement officer.

Support mechanisms: Documentation and Placement Tutors

Support documents are available from: https://our.lsbu.ac.uk/article/our-students/student-placements

Three documents are available, and will be supplied to:

- Students (placement handbook)
- Staff / placement tutors (placement organisers handbook)
- Placement providers (placement provider handbook)

Students in MED will be assigned a placement tutor; a member of the academic team who will be their point of contact during the placement. Students will be notified before and during the placement that they can contact their placement tutor as often as they wish for advice and mentorship during their placement.

Support Mechanisms: Visits

Within the course team, it is the responsibility of each placement tutor to make contact with their respective student(s) and their placement provider regularly while the student is on placement. This can take the form of a visit, email or phone call. In line with LSBU placement procedures, it is the student's responsibility to liaise with their supervisor at their placement so that they are available to meet or speak to their placement tutor at LSBU for 15 to 40 minutes to discuss their progress. There will be a minimum requirement of one meeting or conversation per semester.

H. Course Modules

I. Timetable information

Students can expect to receive a confirmed timetable for study commitments by early-mid September.

Full time students: Wednesday afternoon is generally a teaching-free afternoon set aside for sporting/cultural activities.

Part-time students: Timetabled classes fall on the following days: Year 1 – Monday, Year 2 – Tuesday, Year 3 – Thursday, Year 4 – Wednesday, Year 5 – Friday, Year 6 – Friday.

J. Costs and financial support

Course related costs

- Tuition fees do not cover the following course-related costs: Books, workshop laboratory coats and protective eyewear, clothing required for industrial work placements etc.

Tuition fees/financial support/accommodation and living costs

- Information on tuition fees/financial support can be found by clicking on the following link <u>http://www.lsbu.ac.uk/courses/undergraduate/fees-and-funding</u> or
- http://www.lsbu.ac.uk/courses/postgraduate/fees-and-funding
- Information on living costs and accommodation can be found by clicking the following linkhttps://my.lsbu.ac.uk/my/portal/Student-Life-Centre/International-Students/Starting-at-LSBU/#expenses

Appendix A: Curriculum Map

This map provides a design aid to help course teams identify where course outcomes are being developed, taught and assessed within the course. It also provides a checklist for quality assurance purposes and may be used in validation, accreditation and external examining processes. Making the learning outcomes explicit will also help students to monitor their own learning and development as the course progresses.

Appendix B: Embedding the Educational Framework for Undergraduate Courses

The Educational Framework at London South Bank University is a set of principles for curriculum design and the wider student experience that articulate our commitment to the highest standards of academic knowledge and understanding applied to the challenges of the wider world.

The Educational Framework reflects our status as University of the Year for Graduate Employment awarded by *The Times and The Sunday Times Good University Guide 2018* and builds on our 125 year history as a civic university committed to fostering social mobility through employability and enterprise, enabling our students to translate academic achievement into career success.

There are four key characteristics of LSBU's distinctive approach to the undergraduate curriculum and student experience:

- Develop students' professional and vocational skills through application in industrystandard facilities
- Develop our students' graduate attributes, self-awareness and behaviours aligned to our EPIIC values
- Integrate opportunities for students to develop their confidence, skills and networks into the curriculum
- Foster close relationships with employers, industry, and Professional, Statutory and Regulatory Bodies that underpin our provision (including the opportunity for placements, internships and professional opportunities)

The dimensions of the Educational Framework for curriculum design are:

- **informed by employer and industry** needs as well as professional, statutory and regulatory body requirements
- **embedded learning development** for all students to scaffold their learning through the curriculum taking into account the specific writing and thinking requirements of the discipline/profession
- **high impact pedagogies** that enable the development of student professional and vocational learning through application in industry-standard or authentic workplace contexts
- **inclusive teaching, learning and assessment** that enables all students to access and engage the course
- **assessment** *for* **learning** that provides timely and formative feedback

All courses should be designed to support these five dimensions of the Educational Framework. Successful embedding of the Educational Framework requires a systematic approach to course design and delivery that conceptualises the student experience of the curriculum as a whole rather than at modular level and promotes the progressive development of understanding over the entire course. It also builds on a well-established evidence base across the sector for the pedagogic and assessment experiences that contribute to high quality learning.

This appendix to the course specification document enables course teams to evidence how their courses meet minimum expectations, at what level where appropriate, as the basis for embedding the Educational Framework in all undergraduate provision at LSBU.

| Dimension of | Minimum expectations and rationale | How this is achieved in the |
|---|---|---|
| the | | course |
| Educational | | |
| Framework | | |
| Curricula informed by employer and industry need | <u>Outcomes focus and</u> <u>professional/employer links</u> All LSBU courses will evidence the involvement of external stakeholders in the curriculum design process as well as plan for the participation of | LEVEL 4. Students have an introduction to the engineering profession and professional bodies in Design and Practice. LEVEL 5. Students attend a presentation about industrial |
| | employers and/or alumni through guest lectures or Q&A sessions, employer panels, employer-generated case studies or other input of expertise into the delivery of the course provide students with access to current workplace examples and role models. Students should have access to employers and/or alumni in at least one module at level 4. | placements and are given additional support to prepare their CV for potential placements. Additional preparation sessions are provided and students use the Job Shop and Career Gym support services for interview training etc. LEVEL 6. The IMechE representative gives a lecture on the graduate advantage to final year BEng students. LEVEL 7. The IMechE representative gives a lecture on the graduate advantage to final year MEng students. |
| Embedded learning development | Support for transition and academic preparedness At least two modules at level 4 should include embedded learning development in the curriculum to support student understanding of, and familiarity with, disciplinary ways of thinking and practising (e.g. analytical thinking, academic writing, critical reading, reflection). Where possible, learning development will be normally integrated into content modules rather than as standalone modules. Other level 4 modules should reference and reinforce the learning development to aid in the transfer of learning. | LEVEL 4. All students allocated a personal tutor—coordinated by the Senior Personal Tutor. Personal tutoring is embedded in the level 4 module, Design and Practice where students are given the opportunity to learn about the aspects of PT on their courses. PT open surgeries are bookable on demand. Induction course, including: 1. Meeting with personal tutor 2. Use of library and learning resources (LLR) 3. Use of University IT facilities/VLE 4. Study skills. 5. Access to University support facilities |

| | | information which students will |
| | | use in their engineering career. A |
| | | series of weekly lectures in S1 |
| | | provides students with guidance |
| | | and practical advice to further |
| | | develop specific skills such as |
| | | information searches, referencing, |
| | | software documentation, data |
| | | presentation, and practical |
| | | • |
| | | design, prototyping and testing. |
| | | This module also develops project |
| | | management skills of students. |
| | | LEVEL 7. At level 7 the |
| | | Technical, Research and |
| | | Professional Skills module further |
| | | develops skills required to |
| | | manage the process of gathering, |
| | | analysing, criticising and |
| | | disseminating information, which |
| | | students will use in their |
| | | engineering career. Students are |
| | | taught how to perform a feasibility |
| | | study on an engineering project |
| | | within their degree discipline. |
| Inclusive | Accessible materials, resources and | LEVELS 4-7. All academic staff |
| teaching, | activities | who teach on the course offer |
| learning and | All course materials and resources, | weekly drop-in surgery hours to |
| assessment | including course guides, PowerPoint | all students. For academic staff, |
| | presentations, handouts and Moodle | this is currently set to 4 hours per |
| | should be provided in an accessible | week. During this time, students |
| | format. For example, font type and | can visit the lecturer in their office |
| | size, layout and colour as well as | to ask for academic help on any |
| | captioning or transcripts for audio- | topics covered in lectures, |
| | visual materials. Consideration should | tutorials, laboratory sessions, |
| | also be given to accessibility and the | coursework and exam |
| | | preparation. |
| <u> </u> | | F P |

| availability of alternative formats for | School email and telephone |
|---|--------------------------------------|
| reading lists. | response time: All academic staff |
| | must respond to student emails |
| | and telephone voicemails left on |
| | their office phone within 3 working |
| | days. Staff contact details are |
| | communicated to students in all |
| | module guides. |
| | Personal tutoring: |
| | The School of Engineering |
| | integrates a Personal Tutor |
| | • |
| | Scheme as part of the |
| | Engineering courses offered at |
| | London South Bank University. In |
| | year 1, students will be notified |
| | who their Personal Tutor is early |
| | in semester 1. A Personal Tutor is |
| | a member of the academic team |
| | that can help or advise a student |
| | throughout the academic year. |
| | Direct entry students are also |
| | allocated a Personal Tutor in |
| | semester 1. |
| | Academic clinic: The Academic |
| | Clinic is a weekly 2-hour drop-in |
| | session that runs every |
| | Wednesday (1:00-3:00pm). It is |
| | intended for students at all levels; |
| | especially those studying at levels |
| | 4 and 5. The Academic Clinic is |
| | aimed at students that require |
| | extra one-to-one help with any |
| | particular area of the syllabus that |
| | would be beneficial to them. The |
| | academic advice provided to |
| | students is related specifically |
| | each individuals study needs. |
| | Skills 4 Learning: Based in the |
| | Learning Resources Centre |
| | (LRC), a dedicated team called |
| | Skills for Learning offer an |
| | extensive range of workshops, |
| | drop-ins and one-to-one sessions |
| | designed for all students enrolled |
| | at LSBU and all levels of study, |
| | from foundation year to PhD. The |
| | support offered includes: |
| | Mathematics |

| [| | |
|--------------|---|--|
| | | • Academic Practices, |
| | | English Language |
| | | Skills for Learning also have their |
| | | own site on the VLE which all |
| | | students can access, which |
| | | contains support material and |
| | | information on the workshops, |
| | | drop-in sessions and one-to-one |
| | | sessions that are run. |
| | | Subject specific tutorial support: |
| | | Many timetabled lectures are |
| | | further supported by a separate |
| | | |
| | | accompanying timetabled tutorial. The aim of the tutorials is for |
| | | |
| | | students to take the theories and |
| | | material learnt in the lecture and |
| | | apply it by solving tutorial |
| | | questions. |
| Assessment | Assessment and feedback to support | LEVELS 4-7. The University |

| | awareness, understanding and | computer workshop component. |
| | | |

| | mastery of the specific thinking and communication practices in the discipline is fundamental to applied subject knowledge. This involves explicitly defining the features of disciplinary thinking and practices, finding opportunities to scaffold student attempts to adopt these ways of thinking and practising and providing opportunities to receive formative feedback on this. A writing in the disciplines approach recognises that writing is not a discrete representation of knowledge but integral to the process of knowing and understanding in the discipline. It is expected that assessment utilises formats that are recognisable and applicable to those working in the profession. For example, project report, presentation, poster, lab or field report, journal or professional article, position paper, case report, handbook, exhibition guide. | This is marked periodically and returned with comments and advice. At L4 this forms the basis of the majority of the coursework mark in technical modules. LEVEL 5. See L4. The logbook may form part of the coursework in some modules but this is supplemented by formal reports, mini-projects, and dissertations in most technical modules. LEVEL 6. Project students meet their supervisors at least once/fortnight where progress is monitored and objectives are discussed. In the individual Project students are expected to keep a logbook, which provides a platform for skills development. LEVEL 7. This module requires the inputs of both technical and business elements. Course directors will arrange for students to form teams and will help to allocate staff to act as team supervisors throughout the module. Staff will hold regular meetings with each group to assist and guide. Students will be encouraged to use staff as a resource, as well as |
|---------------------------|---|--|
| | | use staff as a resource, as well as other facilities available within and |
| High impact pedagogies | <u>Multi-disciplinary, interdisciplinary or</u> <u>interprofessional group-based learning</u> <u>experiences</u> Building on experience of group working at level 4, at level 5 students should be provided with the opportunity to work and manage more complex tasks in groups that work across traditional disciplinary and professional boundaries and reflecting interprofessional work-place settings. Learning in multi- or interdisciplinary groups creates the opportunity for the development of student outcomes | outside the University. LEVEL 6. Innovation and Enterprise covers this through the module content and through grouping students together in multi-disciplinary teams across the different courses in the School of Engineering, promoting networking opportunities as well as the opportunities to learn from other engineering disciplines. LEVELS 4-6. Similarly, all students are given an opportunity to participate in either Formula Student Project or Shell ECO Marathon project. The School |

| | | maintaina antiva industry links |
|---|---|--|
| Assessment for learning | including inclusivity , communication and networking. <u>Variation of assessment</u> An inclusive approach to curriculum recognises diversity and seeks to | maintains active industry links through our industrial panel. With regular meetings this panel ensures that industry requirements and needs are fed back into the teaching on our courses and the preparation of our graduates for the workplace. This also improves personal development planning. LEVEL 4. The methods of assessment include, across all modules: Exams, in-class tests |
| | create a learning environment that enables equal opportunities for learning for all students and does not give those with a particular prior qualification (e.g. A-level or BTEC) an advantage or disadvantage. An holistic assessment strategy should provide opportunities for all students to be able to demonstrate achievement of learning outcomes in different ways throughout the course. This may be by offering alternate assessment tasks at the same assessment point, for example either a written or oral assessment, or by offering a range of different assessment tasks across the curriculum. | (phase tests), coursework reports, group reports, group drawings, logbooks, lab reports, group PechaKucha presentation, digital logbook, CAD models, CAD drawings, reflective writing, PDP etc. LEVEL 5. The methods of assessment include, across all modules: Exams, in-class tests (phase tests), coursework reports, group reports, group drawings, logbooks, lab reports, group presentation, individual presentation, digital logbook, CAD models, CAD assemblies, CAD drawings etc. LEVELS 6-7. Includes all of the methods noted above. Additionally, as part of the individual project, and group project, students will submit a Project Arrangement Form and risk assessment documents as part of their submission process. |
| Curricula informed by employer and industry need | <u>Career management skills</u> Courses should provide support for the development of career management skills that enable student to be familiar with and understand relevant industries or professions, be able to build on work-related learning opportunities, understand the role of self-appraisal and planning for lifelong learning in career development, develop resilience and manage the career building process. This should be designed to | LEVEL 4. Students are encouraged to join the relevant professional body for the course; the IMechE. The LSBU Outreach initiative gives talks to student cohorts to encourage individuals to join the University Student Ambassadors scheme and the Mentoring scheme in local schools. The department maintains a course |

| | inform the development of excellence and professionalism . | VLE site including information about professional bodies and this is open to all students throughout their course. Students are encouraged to start their own Student Union Societies or 'clubs'; specific notice-boards are made available for this. LEVEL 5. See L4. Students can study a language to prepare for exchange courses with overseas links. LEVEL 6. Students are made aware of the need for CPD in the level 6 module Innovation and Enterprise. LEVEL 7. Students are further reminded of the need for CPD in the level 7 module Tachnicel |
|--|---|---|
| Curricula informed by employer and industry need / Assessment <i>for</i> learning / High impact pedagogies | <u>Capstone project/dissertation</u> The level 6 project or dissertation is a critical point for the integration and synthesis of knowledge and skills from across the course. It also provides an important transition into employment if the assessment is authentic, industry- facing or client-driven. It is recommended that this is a capstone experience, bringing together all learning across the course and creates the opportunity for the development of student outcomes including professionalism , integrity and creativity . | the level 7 module Technical, Research and Professional Skills. LEVELS 6-7. This is covered in the individual project and group project modules, which are both weighted at 40 credits. |

Appendix C: Personal Development Planning

Personal Development Planning (PDP) is a structured process by which an individual reflects upon their own learning, performance and/or achievement and identifies ways in which they might improve themselves academically and more broadly. Course teams are asked to indicate where/how in the course/across the modules this process is supported.

| Approach to PDP | Level |
|---|------------------|
| 1 Supporting the development and recognition of skills through the personal tutor system. | Level 4, 5, 6, 7 |
| 2 Supporting the development and recognition of skills in academic modules/modules. | Level 4, 5, 6, 7 |
| 3 Supporting the development and recognition of skills through purpose designed modules/modules. | Level 4, 5, 6, 7 |
| 4 Supporting the development and recognition of skills through research projects and dissertations work. | Level 4, 5, 6, 7 |
| 5 Supporting the development and recognition of career management skills. | Level 4, 5, 6, 7 |
| 6 Supporting the development and recognition of career management skills through work placements or work experience. | Level 4, 5, 6, 7 |
| 7 Supporting the development of skills by recognising that they can be developed through extra curricula activities. | Level 4, 5, 6, 7 |
| 8 Supporting the development of the skills and attitudes as a basis for continuing professional development. | Level 4, 5, 6, 7 |
| 9 Other approaches to personal development planning. | Level 4, 5, 6, 7 |
| 10 The means by which self-reflection, evaluation and planned development is supported e.g. electronic or paper-based learning log or diary. | Level 4, 5, 6, 7 |

Appendix D: Terminology

[Please provide a selection of definitions according to your own course and context to help prospective students who may not be familiar with terms used in higher education. Some examples are listed below]

| awarding body | a UK higher education provider (typically a university) with the power to award higher education qualifications such as degrees |
|--------------------------|--|
| bursary | a financial award made to students to support their studies; sometimes used interchangeably with 'scholarship' |
| collaborative provision | a formal arrangement between a degree-awarding body and a partner organisation, allowing for the latter to provide higher education on behalf of the former |
| compulsory module | a module that students are required to take |
| contact hours | the time allocated to direct contact between a student and a member of staff through, for example, timetabled lectures, seminars and tutorials |
| coursework | student work that contributes towards the final result but is not assessed by written examination |
| current students | students enrolled on a course who have not yet completed their studies or been awarded their qualification |
| delivery organisation | an organisation that delivers learning opportunities on behalf of a degree-awarding body |
| distance-learning course | a course of study that does not involve face-to-face contact between students and tutors |
| extracurricular | activities undertaken by students outside their studies |
| feedback (on assessment) | advice to students following their completion of a piece of assessed or examined work |
| formative assessment | a type of assessment designed to help students learn more effectively, to progress in their studies and to prepare for summative assessment; formative assessment does not contribute to the final mark, grade or class of degree awarded to students |

| higher education provider | organisations that deliver higher education |
|------------------------------|--|
| independent learning | learning that occurs outside the classroom that might include preparation for scheduled sessions, follow-up work, wider reading or practice, completion of assessment tasks, or revision |
| intensity of study | the time taken to complete a part-time course compared to the equivalent full-time version: for example, half-time study would equate to 0.5 intensity of study |
| lecture | a presentation or talk on a particular topic; in general lectures involve larger groups of students than seminars and tutorials |
| learning zone | a flexible student space that supports independent and social earning |
| material information | information students need to make an informed decision, such as about what and where to study |
| mode of study | different ways of studying, such as full-time, part-time, e-learning or work-based learning |
| modular course | a course delivered using modules |
| module | a self-contained, formally structured unit of study, with a coherent and explicit set of learning outcomes and assessment criteria; some providers use the word 'course' or 'course unit' to refer to individual modules |
| national teaching fellowship | a national award for individuals who have made an outstanding impact on student learning and the teaching profession |
| navigability (of websites) | the ease with which users can obtain the information they require from a website |
| optional module | a module or course unit that students choose to take |
| performance (examinations) | a type of examination used in performance- based subjects such as drama and music |
| professional body | an organisation that oversees the activities of a particular profession and represents the interests of its members |
| prospective student | those applying or considering applying for any programme, at any level and employing any mode of study, with a higher education provider |

| regulated course | a course that is regulated by a regulatory body |
|----------------------|--|
| regulatory body | an organisation recognised by government as being responsible for the regulation or approval of a particular range of issues and activities |
| scholarship | a type of bursary that recognises academic achievement and potential, and which is sometimes used interchangeably with 'bursary' |
| semester | either of the parts of an academic year that is divided into two for purposes of teaching and assessment (in contrast to division into terms) |
| seminar | seminars generally involve smaller numbers than lectures and enable students to engage in discussion of a particular topic and/or to explore it in more detail than might be covered in a lecture |
| summative assessment | formal assessment of students' work, contributing to the final result |
| term | any of the parts of an academic year that is divided into three or more for purposes of teaching and assessment (in contrast to division into semesters) |
| total study time | the total time required to study a module, unit or course, including all class contact, independent learning, revision and assessment |
| tutorial | one-to-one or small group supervision, feedback or detailed discussion on a particular topic or project |
| work/study placement | a planned period of experience outside the institution (for example, in a workplace or at another higher education institution) to help students develop particular skills, knowledge or understanding as part of their course |
| workload | see 'total study time' |
| written examination | a question or set of questions relating to a particular area of study to which candidates write answers usually (but not always) under timed conditions |

Appendix E: Compliance with PSRB Requirements

Course Learning Outcomes

- A) Students will have knowledge and understanding of: The wider multidisciplinary engineering context and its underlying principles. Graduates must be able to demonstrate this knowledge and they must have an appreciation of it. They must appreciate the social, environmental, ethical, economic and commercial considerations affecting the exercise of their engineering judgement.
- B) Students will develop their intellectual skills such that they are able to: Apply appropriate quantitative science and engineering tools to the analysis of problems. They must be able to demonstrate creative and innovative ability in the synthesis of solutions and in formulating designs. They must be able to comprehend the broad picture and thus work with an appropriate level of detail.
- C) Students will acquire and develop **practical skills** such that they are able to: Possess practical engineering skills acquired through, for example, work carried out in laboratories and workshops; in industry through supervised work experience; in individual and group project work; in design work; and in the development and use of computer software in design, analysis and control. Evidence of group working and of participation in a major project is expected. However, individual professional bodies may require particular approaches to this requirement.
- D) Students will acquire and develop transferrable skills such that they are able to: Apply the developed transferable skills that will be of value in a wide range of situations. These are exemplified by the Qualifications and Curriculum Authority Higher Level Key Skills and include problem solving, communication, and working with others, as well as the effective use of general IT facilities and information retrieval skills. They also include planning self-learning and improving performance, as the foundation for lifelong learning/CPD.

Teaching and Learning Strategy

Knowledge and Understanding

Acquisition of knowledge and understanding is acquired through in the main by the following modules:

- Engineering Mathematics and Modelling L4
- Solid Mechanics and Materials L4
- Electrical Circuit AnalysisL4
- Fluid Mechanics and Thermodynamics L4
- Solid Mechanics and Finite Element Analysis L5
- Dynamics and Control L5
- Thermofluids and Sustainable Energy L5
- Vehicle Dynamics and System Modelling L6
- Vehicle Powertrain, Sustainability and 1D CFD L6
- Advanced Vehicle Dynamics, NVH, Structures and Crash-Safety L7
- Advanced Powertrain Systems, Vehicle performance and 3D-CFD-L7

All of these modules teach and develop knowledge and understanding within a multidisciplinary engineering context and those at higher levels involve a degree of commercial awareness through design of systems to specifications.

Intellectual Skills

 Acquisition of Intellectual Abilities is gained through the Level 5 Engineering Design as well as the level 6 BEng honours project. In these modules students are taught the appropriate tools to solve engineering problems. Innovation is covered in the module entitled Innovation and Enterprise at Level 6, which develops business ideas from innovative research and development activities. The module on Technical, Research and Professional Skills at Level 7 carries this stage further. The Level 7 Group Project challenges students to cope with tasks that are broad in scope and detailed in context making them very complex.

Practical Skills

- Acquisition of PS is acquired during the practical laboratory sessions which constitute a part of nearly every module for this course.
- Fluid Mechanics and Thermodynamics at Level-4 incorporate a significant practical laboratory element.
- Engineering Design at Level-5 offers physical prototypes to be made using practical workshops and rapid prototyping equipment
- Thermofluids and sustainable energy at Level-5 offers a practical workshop to analyse the performance of a sustainable-energy power-producing device
- Vehicle Powertrain, Sustainability and 1D-CFD at level 6 offers advanced engine research lab exercise as well as a variety of computer based exercise.
- Dynamics and Control at Level-5, Dynamics and System modelling at Level-6 offers classical control workshops, dynamics workshop as well as a variety of computer based laboratory exercises.
- Machine Drives and Mechatronics at Level-5 will offers the workshop and lab exercise in electric motors, gears, clutches and bearings.
- Further development of these skills is acquired in the Level 6 Individual Project and Level 7 Group Project.

General Transferable Skills

Acquisition of GTS is achieved through communication of knowledge in formal reports. These constitute a part of the assessment for the majority of modules on the course to include,

- Engineering Design L5
- Innovation and Enterprise L6
- Individual Project L6
- Technical Research and Professional Skills L7

These skills are also developed during work on the level 7 group project.

1. Knowledge and understanding

- A1: Acquisition starts in Level 4 lectures and tutorials concentrating on the basic essentials of science and mathematics. The Solid Mechanics and Materials and Fluid Mechanics and Thermodynamics modules cover the essential physics behind the study of thermodynamics, mechanics, materials and matters. This work continues in the Electrical Circuit Analysis module which covers the science behind DC and AC circuit behaviour and the sensing of light, temperature, movement and force in terms of basic laws and principles.
- In Levels 5 and 6 this appreciation of scientific principles in engineering continues in Solid Mechanics and FEA, Thermofluids and Sustainability, Dynamics and Control, Vehicle Dynamics and Systems Modelling, and Vehicle Powertrain, Sustainability and 1D-CFD.

- A2: This is covered primarily by the mathematics module, which teaches the mathematical techniques and tools needed to model, understand and predict the science behind engineering designs and operations. In Level 5 these techniques are continued in another mathematics module where studies cover more advanced mathematical and computational techniques—advanced vector and matrix algebra, experience in solving differential equations analytically, numerical methods and optimisation techniques. Evidence of achieving this LO can also be found in several other analytical modules, in particular Dynamics and Control, and Vehicle Dynamics and Systems Modelling.
- A3: The acquisition starts in Level 4 with practical examples in the use and interfacing of transducers, sensors and basic I/O devices in the Electrical Circuit Analysis module. This is covered further in the teamwork design exercises in the Design and Practice module, where integration of mechanical design and software engineering is introduced for product prototyping. The Engineering Design, and Machine Drives and Mechatronics modules at Level 5 and the Dynamics and System Modelling module at Level 6 also utilise design problems taken from electro-mechanical engineering and a wide variety of engineering subjects. Additionally, the multidisciplinary nature of the Level 6 Individual Project explores this integration of engineering disciplines more than other modules. Students undertaking their project are routinely required to demonstrate their knowledge from other engineering fields.
- Acquisition of **A4** and **A5b** is achieved by study in Level 4 modules: Solid Mechanics and Materials; Fluid Mechanics and Thermodynamics; and Electrical Circuit Analysis. This continues in Levels 5 and 6 via the study of Solid Mechanics and FEA, Thermofluids and sustainability, Engineering Design and Dynamics and Control. These modules include the development and use of mathematical models for components and systems for analysis and synthesis, performance evaluation, and understanding practical operation. standard analytical methods for representation and analysis of systems and components are also studied, for example, Finite Element Analysis, Computational Fluid Dynamics.
- The **A6** learning outcomes are achieved in the Level 4 Mathematics and Modelling module where for example, node and mesh analysis and matrix manipulation methods are taught. In Level 5 computer-based mathematical tools such as Matlab/Simulink are used to solve problems, including matrix inversion, iterative techniques, finite difference analysis of nodes and meshes. Students use industry standard software at Levels 5 and 6 for quantitative analysis of performance, to evaluate scenarios, and produce designs. The Level 6 Individual Project requires acquisition of quantitative analysis and software skills to complete and demonstrate understanding of the work undertaken.
- The **A7** learning outcome is achieved after the basic design building blocks have been taught and understood in earlier years. An approach to systems is found in Engineering Design at Level 5 where systems thinking are covered within the context of project management. A number of modules at higher levels utilise systems design strategies.

2. Intellectual skills

B1: Essential design constraints including environmental and sustainability considerations are introduced at Level 4 through the Design and Practice module, which is common to all engineering courses. Engineering Design project at Level 5 also contains material on resources and budgets for engineering project management. Design exercises in specialist modules at Levels 5 and 6 also focus on environmental, sustainability and health and safety compliance.

- **B2** is covered in the common module entitled Design and Practice at Level 4. User needs are covered in the Innovation and Enterprise module at Level 6.
- D3: Cost as a factor in design is taught at Levels 5 in modules that deal with project management and at Level 6 through design of systems from specifications and user requirements.
- **B4:** Innovative technical solutions are taught in the design component of each specialist module, mainly at Levels 6. The generic creative and innovative process is covered in the Innovation and Enterprise module at Level 6.
- **B5:** Fitness of purpose as well as life-cycle product management is considered in modules in the professional and industrial thread.
- **B6:** Managing the design process and evaluating outcomes features in many modules where the design thread runs in order to enable students to exercise their ability to be creative in providing solutions to engineering problems.
- **B1–B6** are also addressed in varying degrees in the Level 6 Individual Project, where students are expected to find fit for purpose creative solutions by managing and applying the design processes taught in earlier years. An evaluation of the outcomes of their solution is required.
- **B7** and **B8** are acquired in Design and Practice at Level 4 and at higher levels through Engineering Design at level 5 and at Level 6 Innovation and Enterprise.
- Sustainable development **B9** is introduced at level 4 in Design and Practice. Further work is done at higher levels through modules that embody systems features and components, for example, Engineering Design at Level 5, Thermofluids and sustainability at Level 5.
- **B10** is acquired at Level 4 in Design and Practice, and continues at level 5 through Engineering Design.
- **B11** is acquired through the modules in the professional and industrial thread, which permeates throughout the course namely, Design and Practice at Level 4, Engineering Design at Level 5, and Innovation and Enterprise at Level 6. Depending on its particular emphasis, aspects of **B7–B12** will also be acquired in the Level 6 Individual Project.

3. Practical skills

- The **C1** outcome is delivered in Level 4 by the study of different materials and measurement principles in the Solid Mechanics and Materials module along with use of CAD tools and measurement equipment in the Design and Practice module. This is also covered in Level 5 through the projects set in the Engineering Design module. This continues throughout the course where characteristics of materials and equipment are covered in later technical modules.
- C2 is acquired through a large number of modules where laboratory activity is recorded in logbooks. At Level 4 in Design and Practice a general approach to engineering workshop and laboratory work is taken. In later years this activity continues with more technically specific laboratory, design and computer-based workshops which include practical investigations, design exercises and CAD simulations to develop more advanced skills.

- The achievement of **C3**, **C4** and **C5** is facilitated mainly by the team design project of the Engineering Design module that covers planning, research and communication process in project management but also in other modules. The ability to understand and use technical literature along with the understanding of intellectual property, starts in the professional and industrial thread in Level 4 Design and Practice module and gradually builds throughout the course, to include the coverage of industry standards and environmental impact issues in the Innovation and Enterprise module at Level-6.
- The industrial codes of practice and quality issues of **C6** and **C7** are similarly covered in the professional modules on the course and in some other modules.
- **C8**: Working with uncertainty, outcome is introduced in the Level 4 practical sessions, with its theory being covered in the Level 4 Mathematics module. In the project modules at Levels 6 students are expected to discuss their outcomes in terms of error predictions, measurements and the optimisation of technical uncertainties.

6. Transferrable skills

- The D1 outcome of applying their skills in problem solving, information retrieval is acquired in Level 4 Engineering Mathematics and Modelling, Fluid Mechanics and Thermodynamics and Design and Practise modules. Level-5 Advanced Engineering Mathematics and Modelling, Solid Mechanics and FEA, Thermofluids and Sustainable Energy, Dynamics and Control. Machine Drives and Mechatronics and Level-6 Dynamics and System modelling, Thermofluids and Turbomachinery and Level-7 Advanced Powertrain Systems, Vehicle Performance and 3D-CFD, Advanced Vehicle Dynamics, NVH, Structures and Crash-Safety modules. The communications, information retrieval, working with others are covered in Level-4, and 5, Level-6 Individual Projects and Level-7 Group Projects. The use of general IT facilities is integral part of the learning process across all levels.
- The achievement of D2 is acquired through Level-4 Design and Practice and integrated with personal tutoring system. This will also have facilitated by registering all students to become IMechE student membership and encouraging them to attend the free talk and making them to work closely with their professional body by laying strong foundation for lifelong learning/CPD. This will also continue in Level-5 Engineering Design with IMechE design challenge and further continues in Level-6 Individual Project, Formula student and Shell ECO marathon projects.
- The achievement of **D3**, is facilitated mainly by the Level-6 Individual Project and Level-6 Group Project
- The achievement of **D4** is initiated and monitored in the group project from Level-4 Design and Practice, Level-5 Engineering Design and Level-6 Innovation and Enterprise

In addition to these and in respect of general transferable skills, the following enhanced outcomes should be expected of MEng degree graduates:

The ability to develop, monitor and update a plan, to reflect a changing operating environment; **Teaching and learning strategies:**

Acquisition of these skills is through the module entitled Technical, Research and Professional Skills. The module on Innovation and Enterprise also deals with assessing opportunities of technologies within the business context.

The ability to monitor and adjust a personal programme of work on an on-going basis, and to learn independently;

AQE October 2017

Teaching and learning strategies:

Acquisition of these skills is through the module entitled Technical, Research and Professional Skills as well as project-based modules at levels 5, 6 and 7.

The ability to exercise initiative and personal responsibility, which may be as a team member or leader;

Teaching and learning strategies:

Acquisition of these skills is through the Engineering Design module at level 5 and also the major group project module at level 7.

The ability to learn new theories, concepts, methods etc. and apply these in unfamiliar situations. **Teaching and learning strategies:**

Acquisition of these skills is through the module on Innovation and Enterprise. Here students are expected to consider innovative technology ideas derived from academic areas and assess these for suitability in a commercial environment.

Assessment

1. Knowledge and understanding

- **A1, A8:** Assessment of the knowledge base is through examinations, mini tests and assignments, which frequently demand that the student extend knowledge of a subject by self-learning.
- **A2, A9:** Underpinning the understanding of their engineering discipline is assessed via assignments and laboratory activity. Emphasis is made on producing a design component in assignments as well as written examinations.
- **A3, A10:** Ability to apply and integrate knowledge is assessed by larger scale project work as well group assignments (where appropriate) and logbooks. Additionally in written examination emphasis is placed on producing conceptual design solutions to projects that span across engineering disciplines.
- A11, A12, and A13: These are assessed through analytical-based problems in coursework and examination at level7.
- **EA1p, A14:** Engineering analysis skills in applying the knowledge base are assessed in tutorials. The more extended skills are assessed via assignments and project reports.
- **A5p, A5m:** Modules at levels 5, 6 and 7 see progressively more design based and systems analysis questions in examinations.
- **EA3p and EA4p:** Level 6 Individual Project offers the best chance for students to demonstrate their ability to apply a systems approach to solving engineering problems. At levels 5, 6 and 7, laboratory workshops and assignments are often based on analysing systems performance in modules such as Thermofluids and sustainability among others.
- **A15:** Mathematical modelling and simulation skills are assessed by coursework assignments and logbooks
- A16, A17 and A18: These are assessed through number of modules of the course, for example, Level 5 Engineering Design; Level 6 Individual Project and Innovation and Enterprise; and Level 7 Group Project.

2. Intellectual skills

- **B1** is assessed specifically via standard logbooks and some exercises and tests in the early modules, and later by forming part of the checklist of elements for which marks are awarded in the assessment of small and larger projects. These are formally assessed in Level 4 in simple 'design and make' exercises. Further development of these skills is more indirectly assessed, in that significant achievement in these areas is necessary for the highest marks, particularly in project work, which includes assessment by presentation and viva-voce examinations.
- **B2:** Practical laboratory sessions and software workshops provide a means to assess this through assignments and logbooks. Examinations are also used to challenge students to design a system based on specific (that are necessarily brief) user requirements. Students are encouraged to make design assumptions in order to demonstrate their understanding of the importance of requirements specification.
- **B3** is assessed by design assignment reports at different levels across modules that have a strong design component.
- **B4** and **B5** are assessed via engineering reports and presentations. Some modules specifically employ practical simulation exercises as a major part of the assessment. Project management plays a primary role in assessment of the major Level 6 Individual Project, both in an initial (progress) report and in the final report which has to describe the projects process activity.
- **B1m** and **B2m** are assessed by project reports and presentations by teams and individuals.
- **D3m–B14** are assessed in a number of modules of the course through project work, group presentation, individual presentation, technical report, business plan etc.
- In early years B8b and B9 are assessed primarily by logbooks and assignments based on tutorial work and laboratory activity. In Level 6 these are assessed by the project modules assessment criteria. B10 and B11 are assessed by assignments which are based on tutorial work and laboratory session and which require formal design based on user requirements.
- **B7, B9** and **B12** are assessed in project work, through various components including presentation session and viva-voce examination.

3. Practical skills

- C1 is assessed by laboratory exercises and tutorial assignments.
- **C2** and **C2m** are assessed specifically via standard logbooks and reports based on laboratory activity.
- **C3** is assessed by design assignments and also some exercises and tests in the early modules, and later by forming part of the checklist of elements where marks are awarded in assessing small and larger projects.
- C4 is assessed by project work where students are required to provide background information as well as suitable referencing for their assignment. Level 7 Technical, Research and Professional Skills specifically addresses referencing and literature survey LOs.

- C5 and C6 are initially assessed in year 1 in simple 'design and make' exercises. Further development of these skills is indirectly assessed through design assignments in specialist modules at Levels 6 and 7. Additionally these are assessed in the Level 6 individual and the Level 7 group projects both of which include assessment by presentation and viva-voce examinations.
- **C7** is specifically assessed through Electric Vehicle and Power Electronics at Level 6. It is also indirectly assessed by work on the individual Project at Level 6.
- **C8** is assessed in design exercises during tutorial session and well as assignments. The coursework assignments set in the Level 5 module Engineering Design also assesses the ability to work with technical uncertainty. It is also assessed in Level 6 Individual Project work and the Level 7 Group Project.
- **C11b** is assessed in project work, report, individual presentation and group presentation at Level 6 Innovation and Enterprise and Level 7 Group Project. This is also assessed at level 7 by project assessment components such as the feasibility study in Technical, Research and Professional Skills which covers project costing and payback calculations.

4. Transferable skills:

- **D1** is assessed by exam, course work report and project reports.
- **D2** is assessed by course work and PDP report.
- **D3** and **D5** are assed in project report and presentation.
- **D4** is assessed in the individual and group presentation.
